

Results of recent Aladin verification

Zoran Vakula and Lovro Kalin, Meteorological and Hydrological Service of Croatia

Motivation

- evaluate skill for “new” Aladin Croatia model
- compare scores with other models - Aladin Lace model and ECMWF global model

Aladin

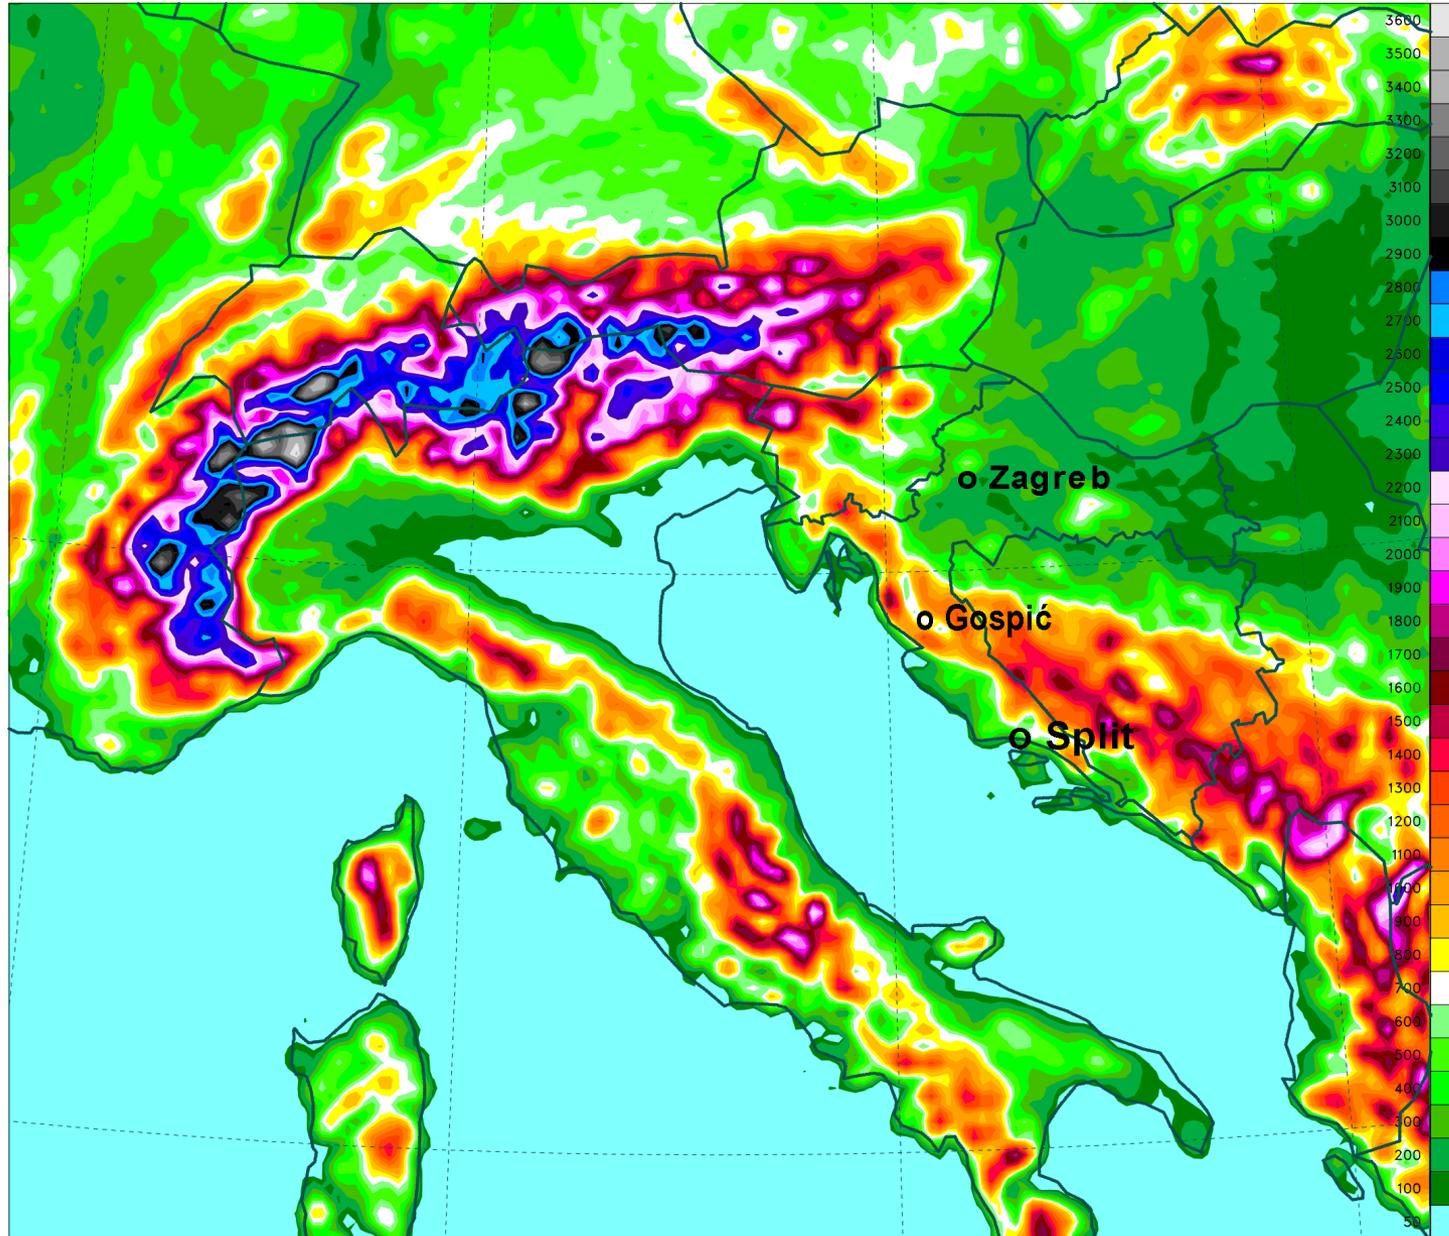

- Aladin Lace started in 1996 in Prague
- from 2003 run in Zagreb, Croatia
- Aladin Cro started in 2000 in Zagreb

Aladin Croatia

- runs operationally for 00 and 12 UTC
- boundary conditions from Aladin Lace
- smaller domain
- resolution reduced to 8 km
- dynamical adaptation of wind field to 2 km

Base0001/01/15 00UTC
INITIAL

HRn8 (new) OROGRAPHY 8 km [m]

variables and scores

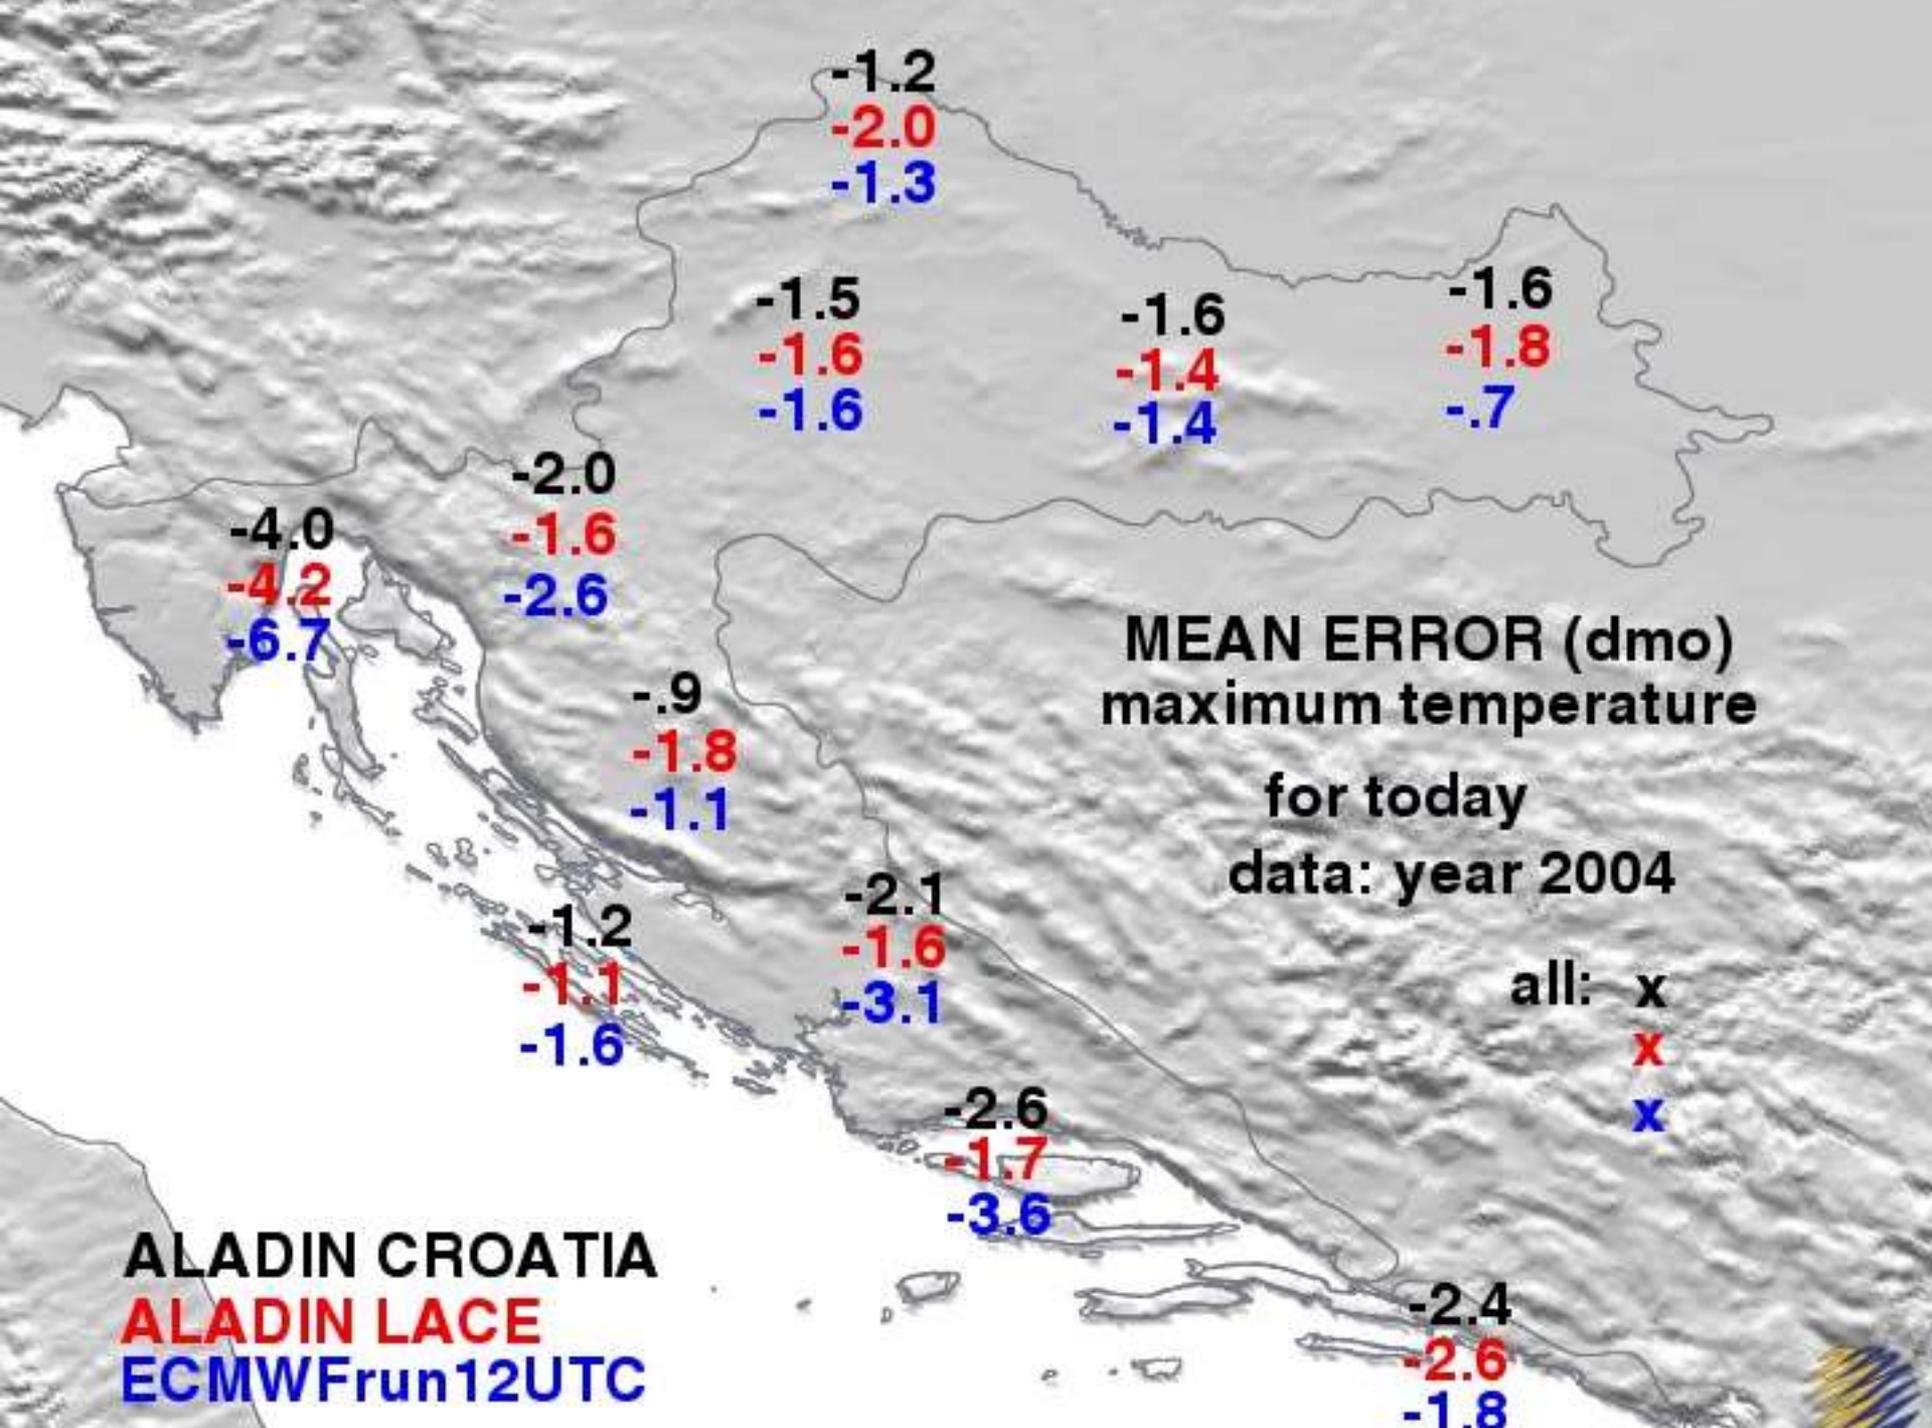

- temperature - ME, MAE, RMSE, SS
- precipitation - bias, KSS, HSS, ETS
- wind - mean values, stdev, correlation coeff

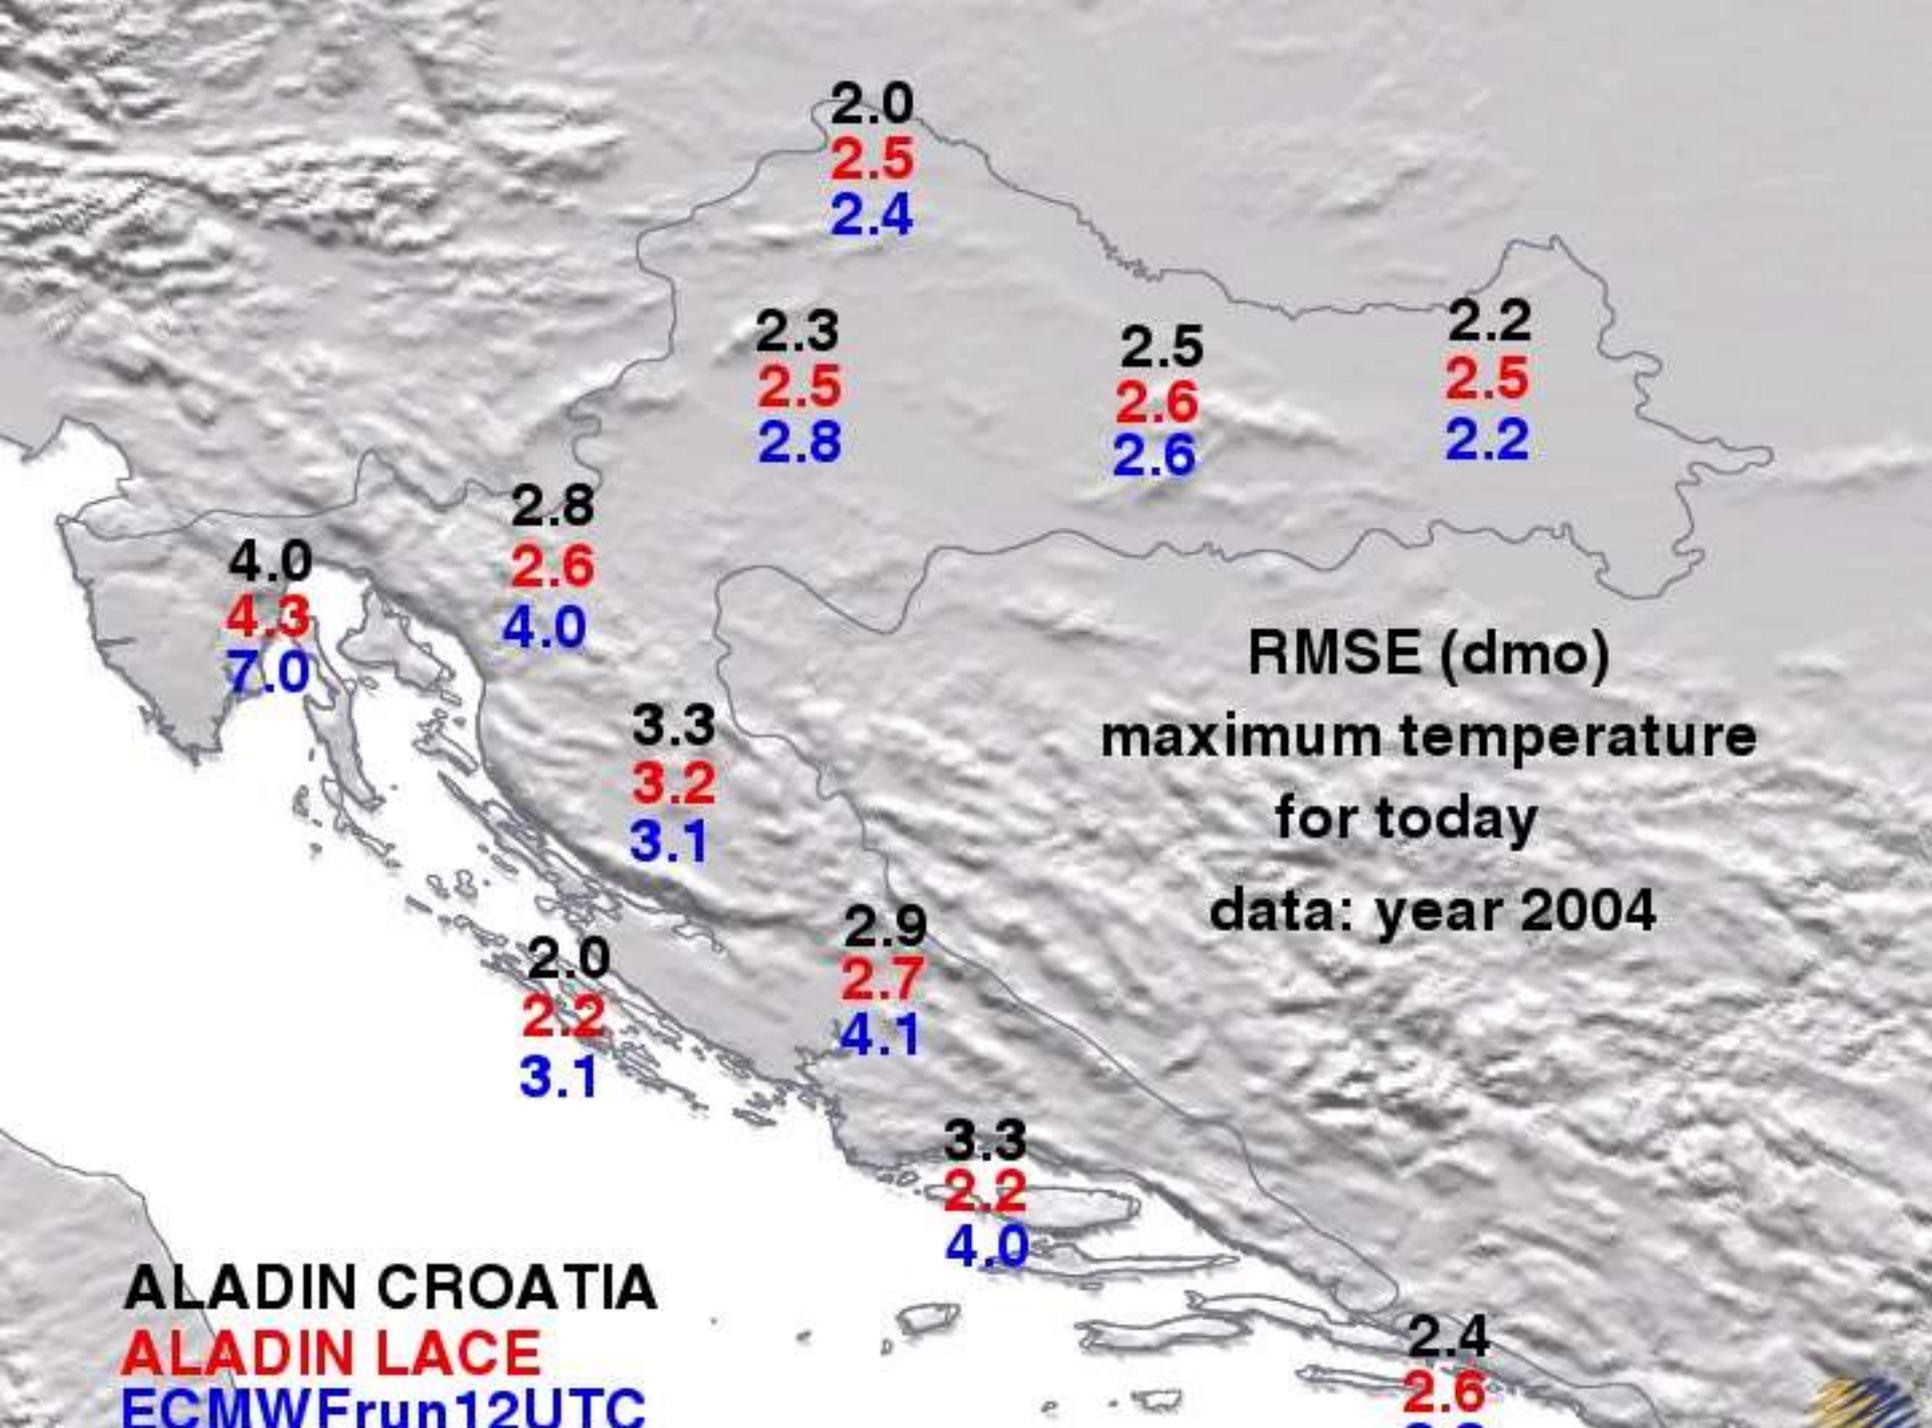

Wilks, D.S., 1995: *Statistical Methods in the Atmospheric Sciences: an Introduction*

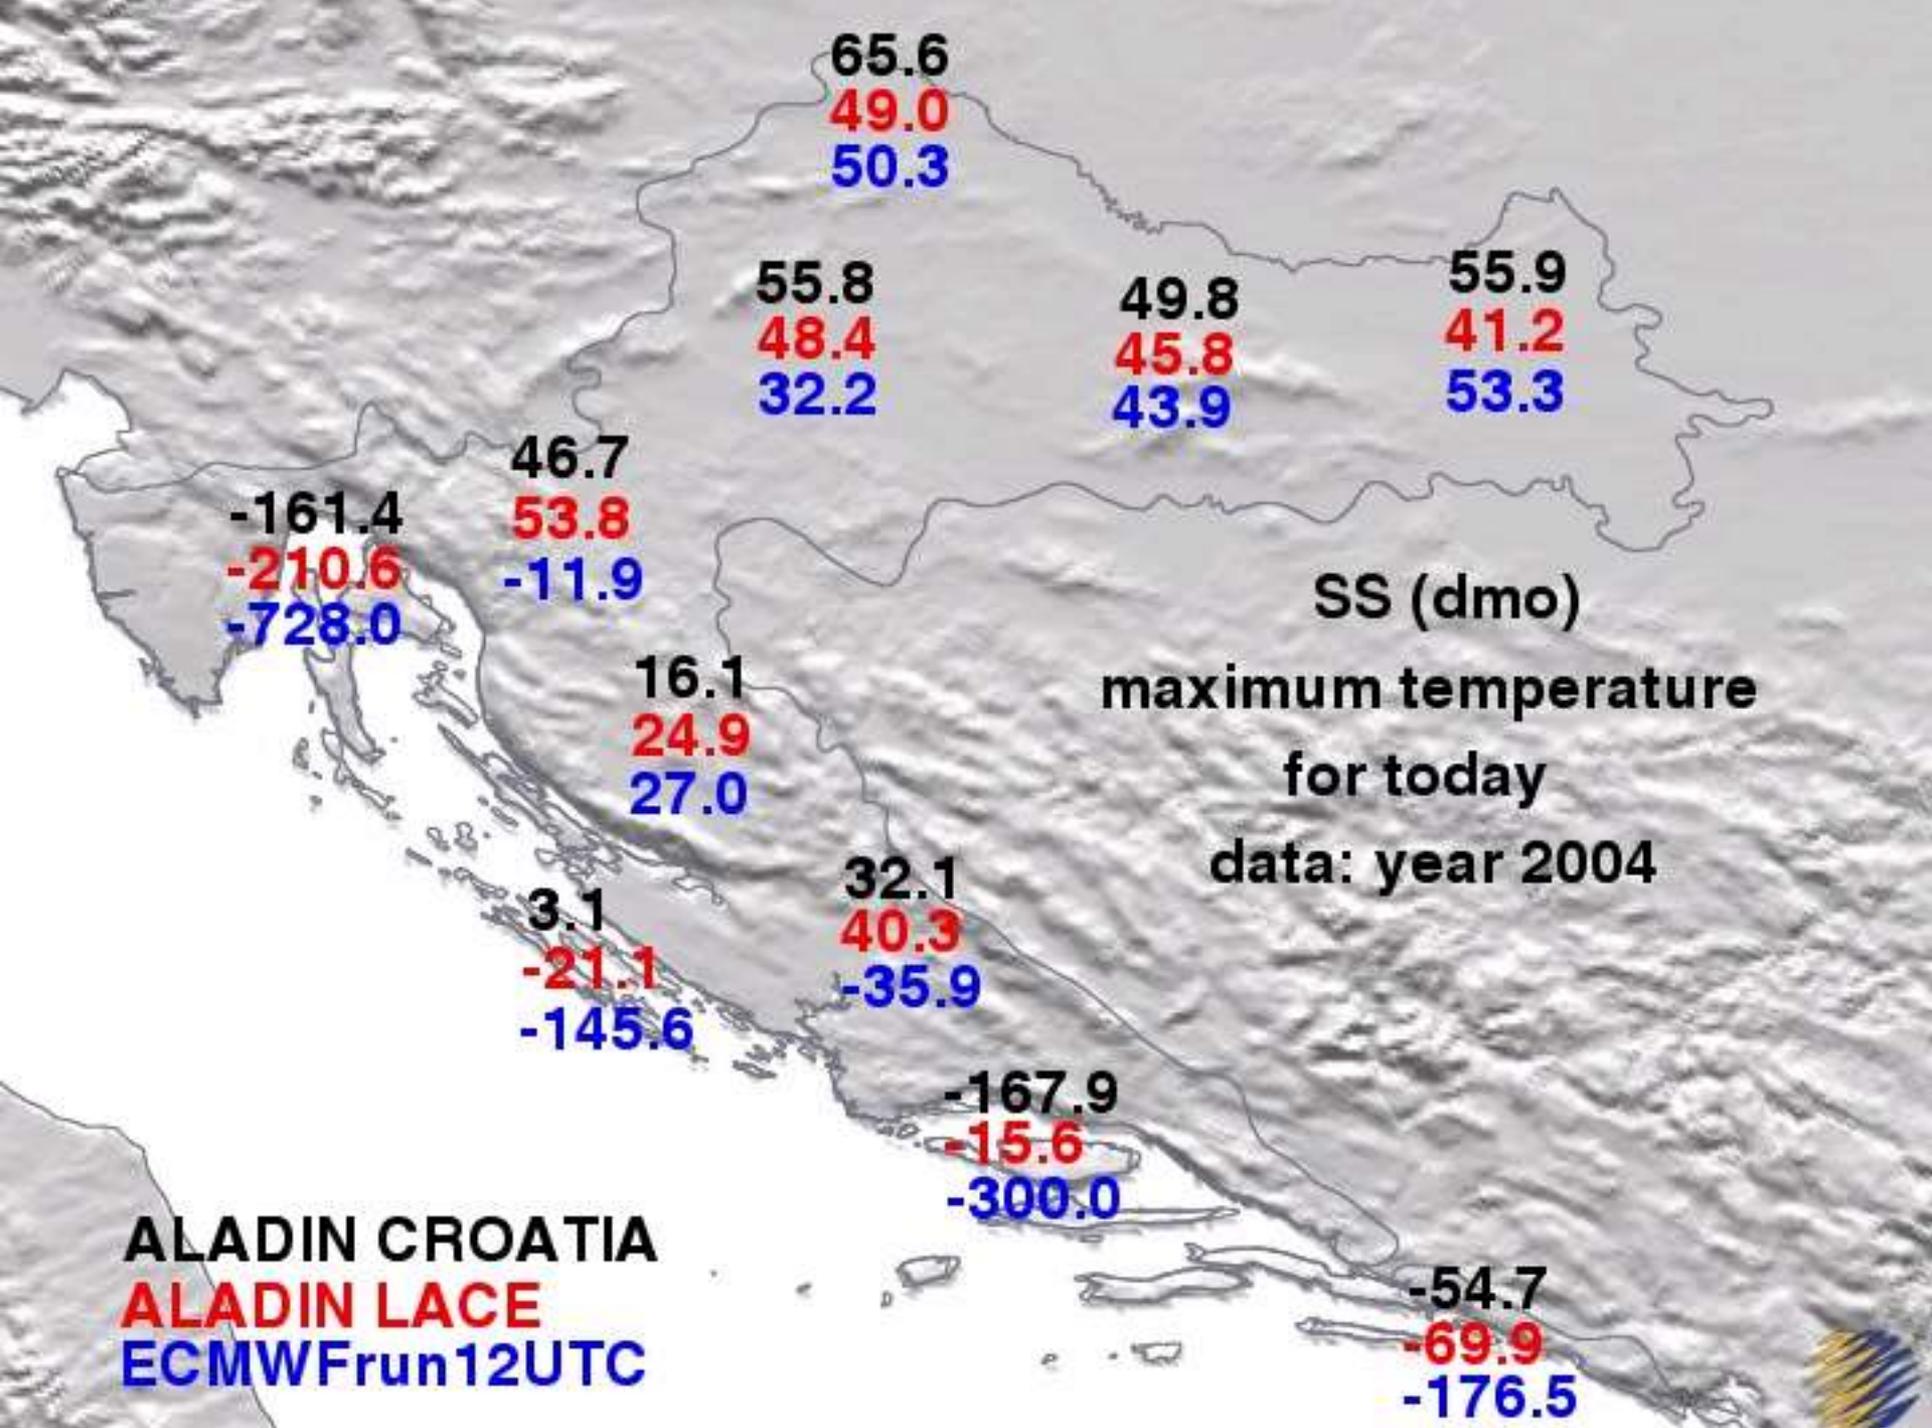

Nurmi, P., 2003: *Recommendations on the verification of local weather forecasts*, ECMWF Technical Memorandum No. 430

Temperature

- 2m temperature for today and tomorrow
- scores
 - ME
 - MAE
 - RMSE
 - SS (over climatology or persistence)

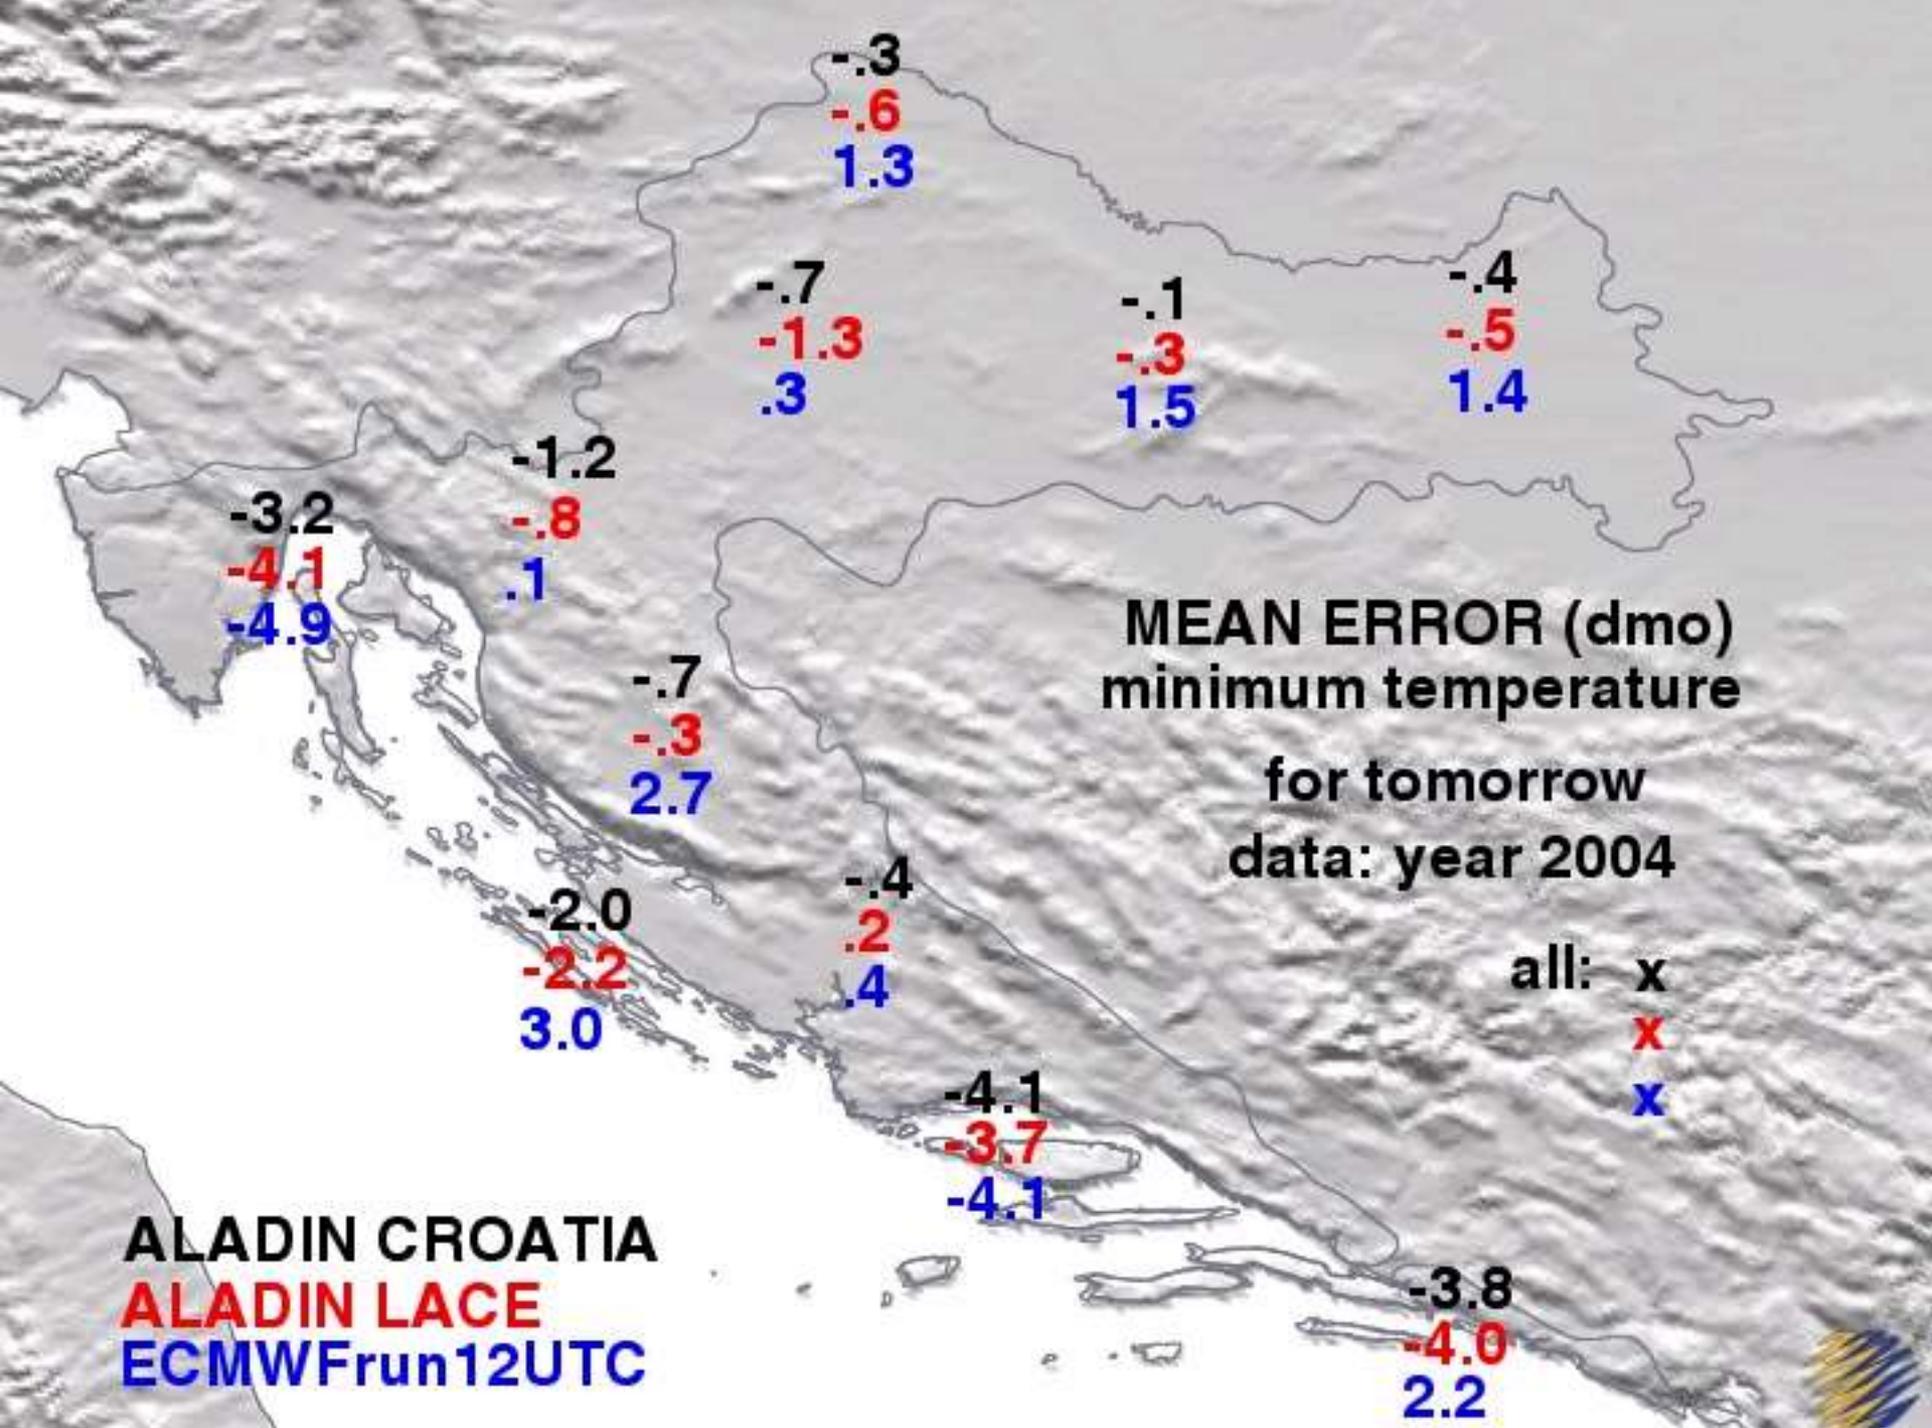

ALADIN CROATIA
ALADIN LACE
ECMWFrun12UTC

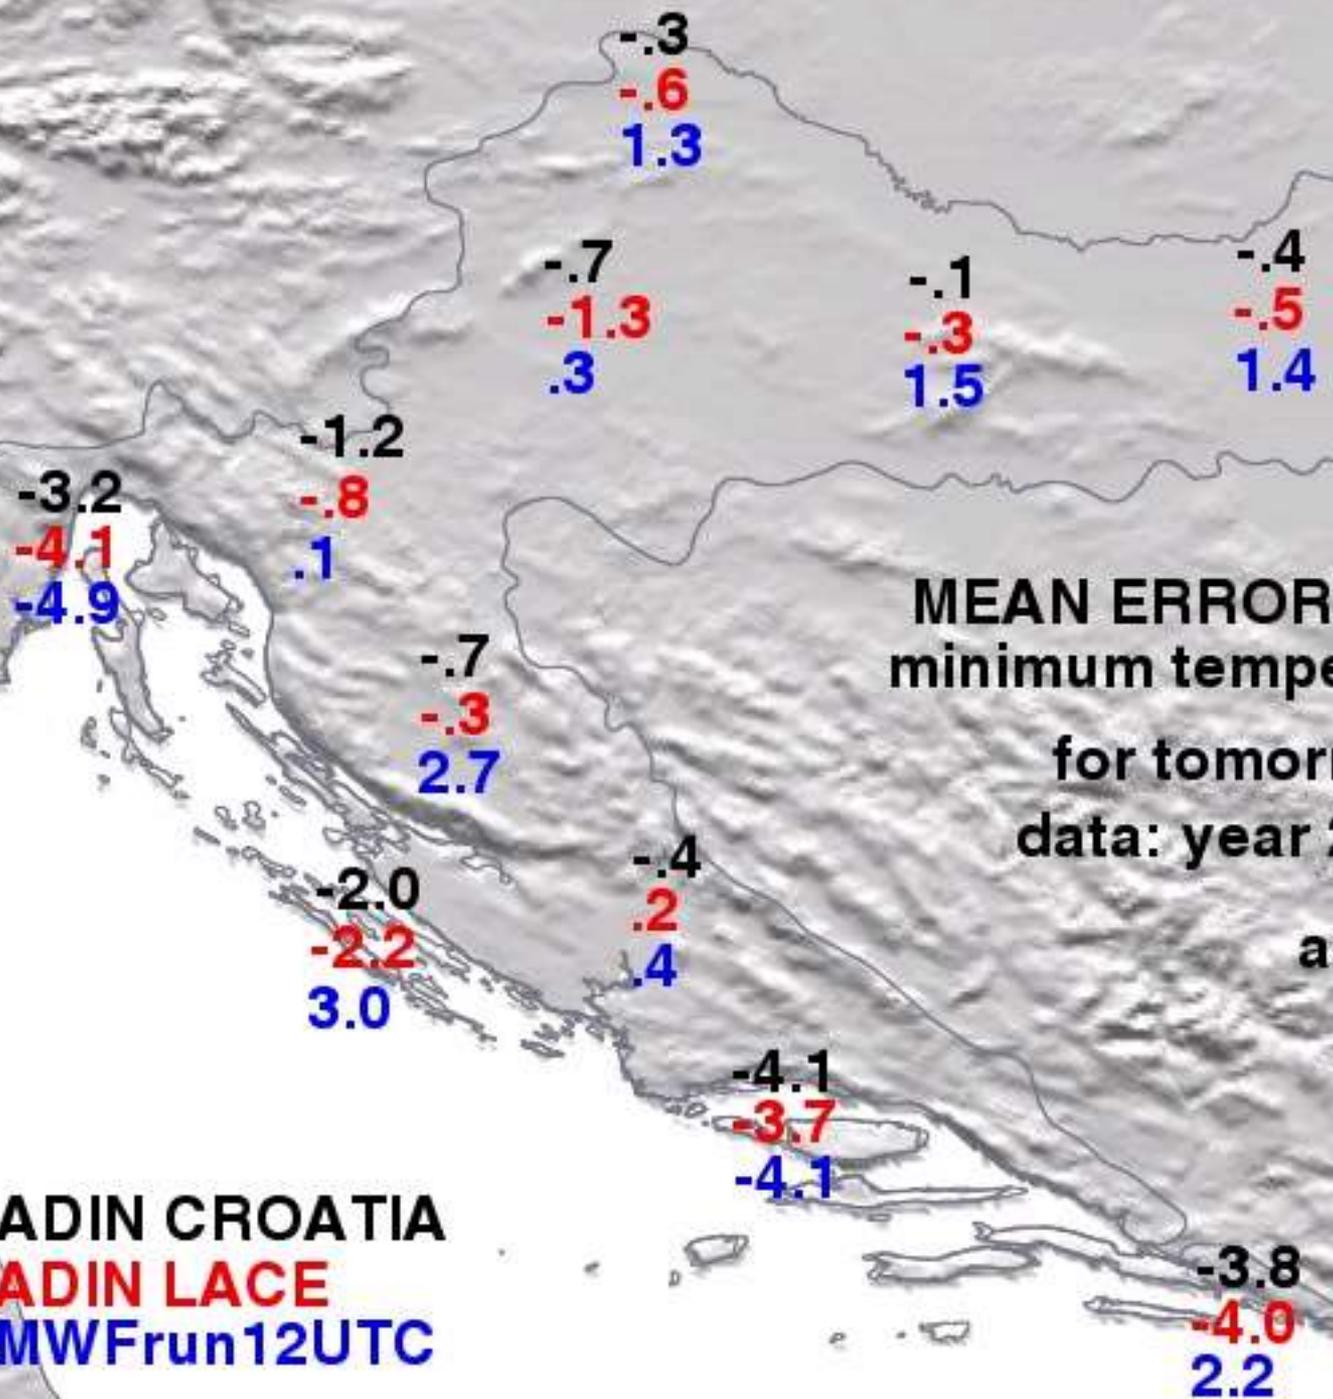

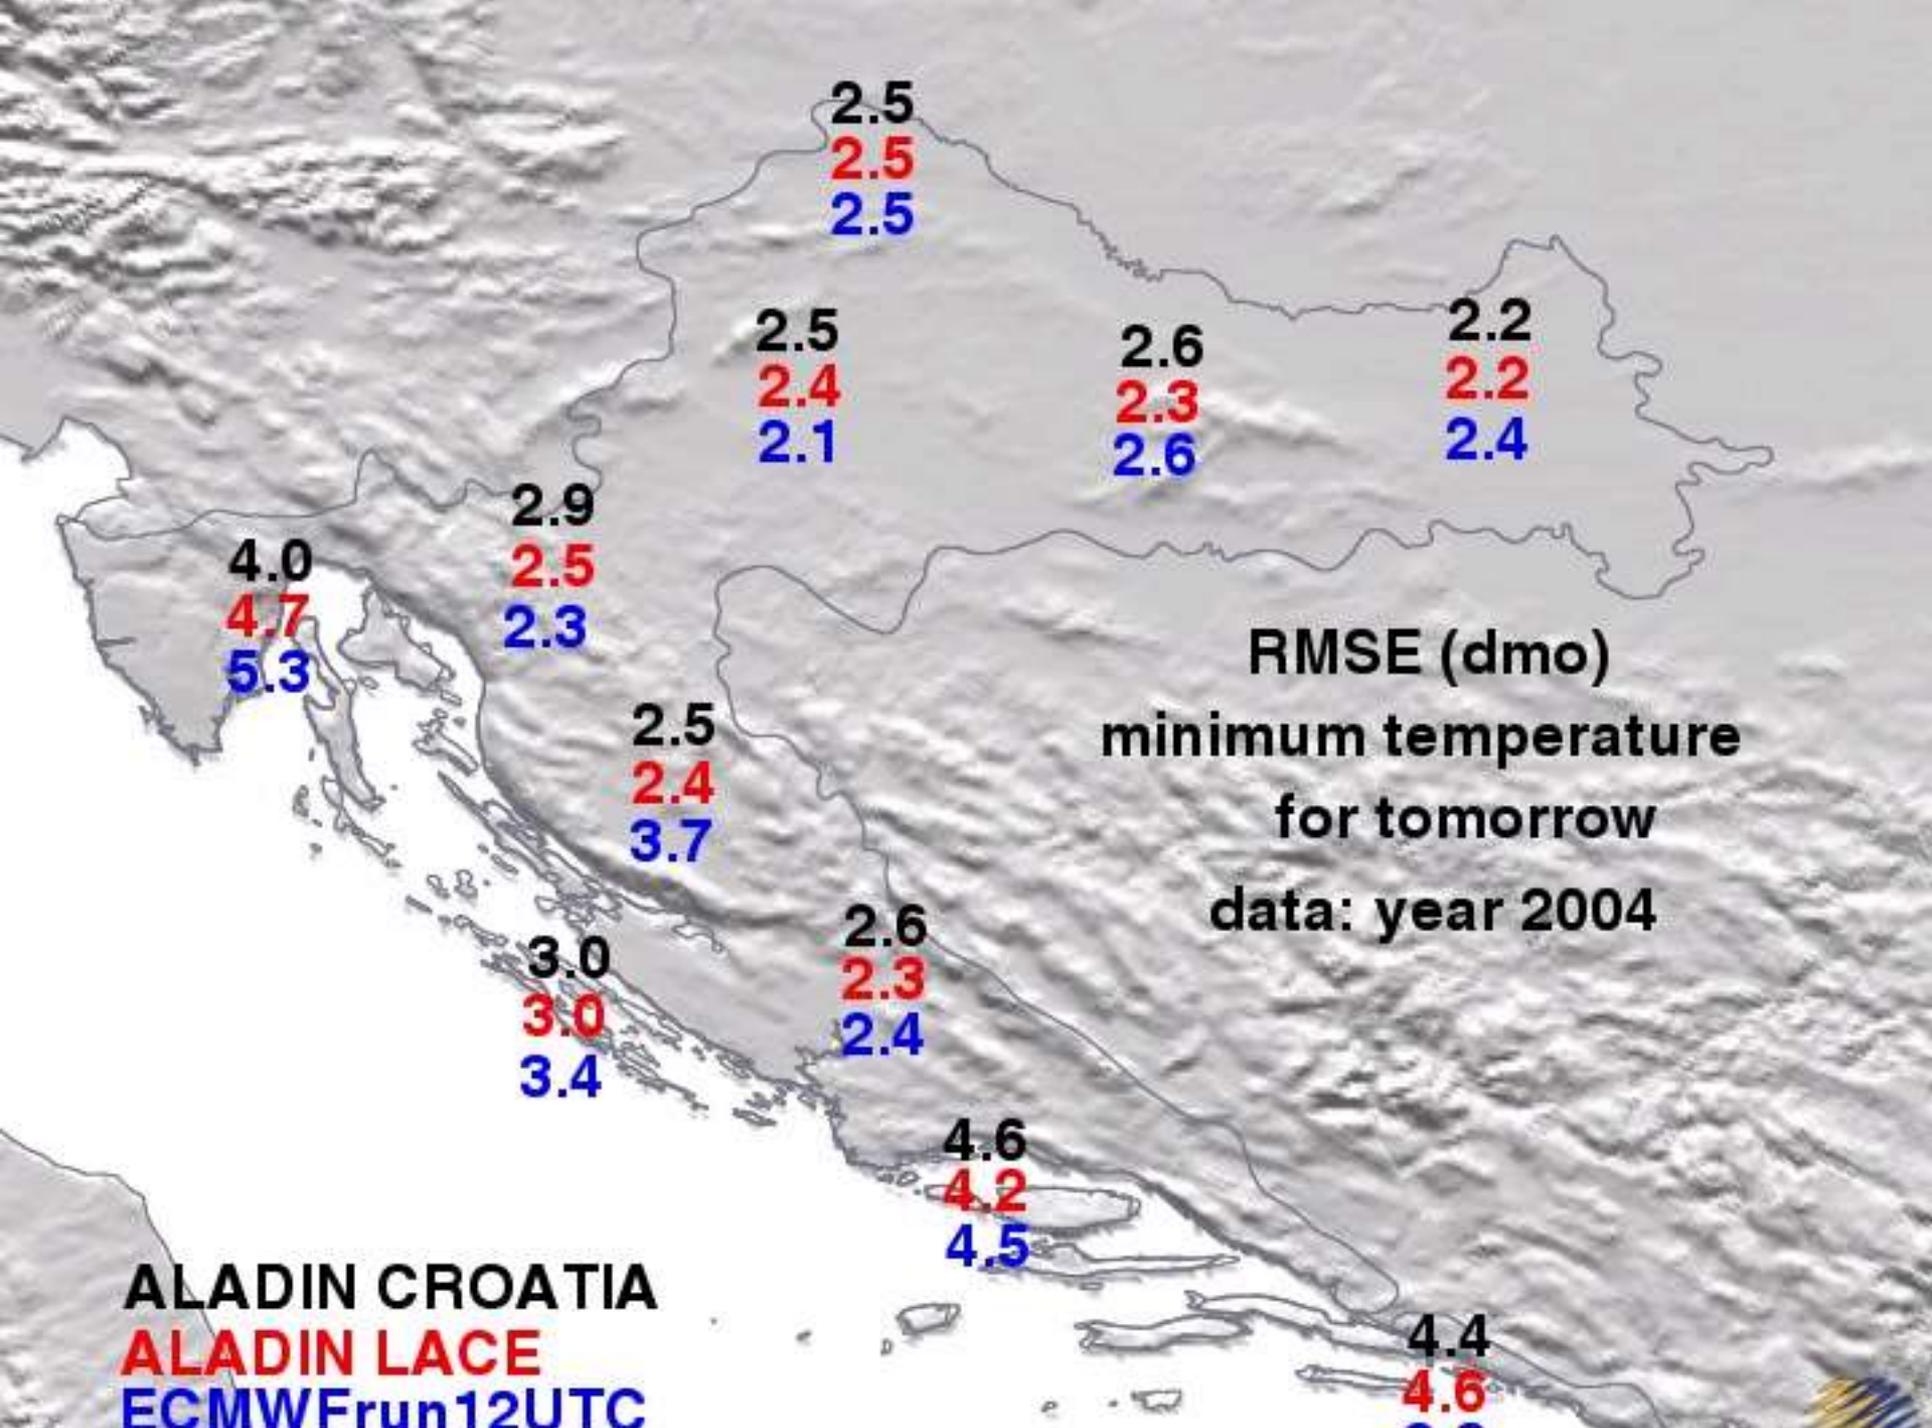

MEAN ERROR (dmo)
minimum temperature
for tomorrow
data: year 2004

Temperature for Zagreb Maksimir (continental)
Jan - Dec 2003

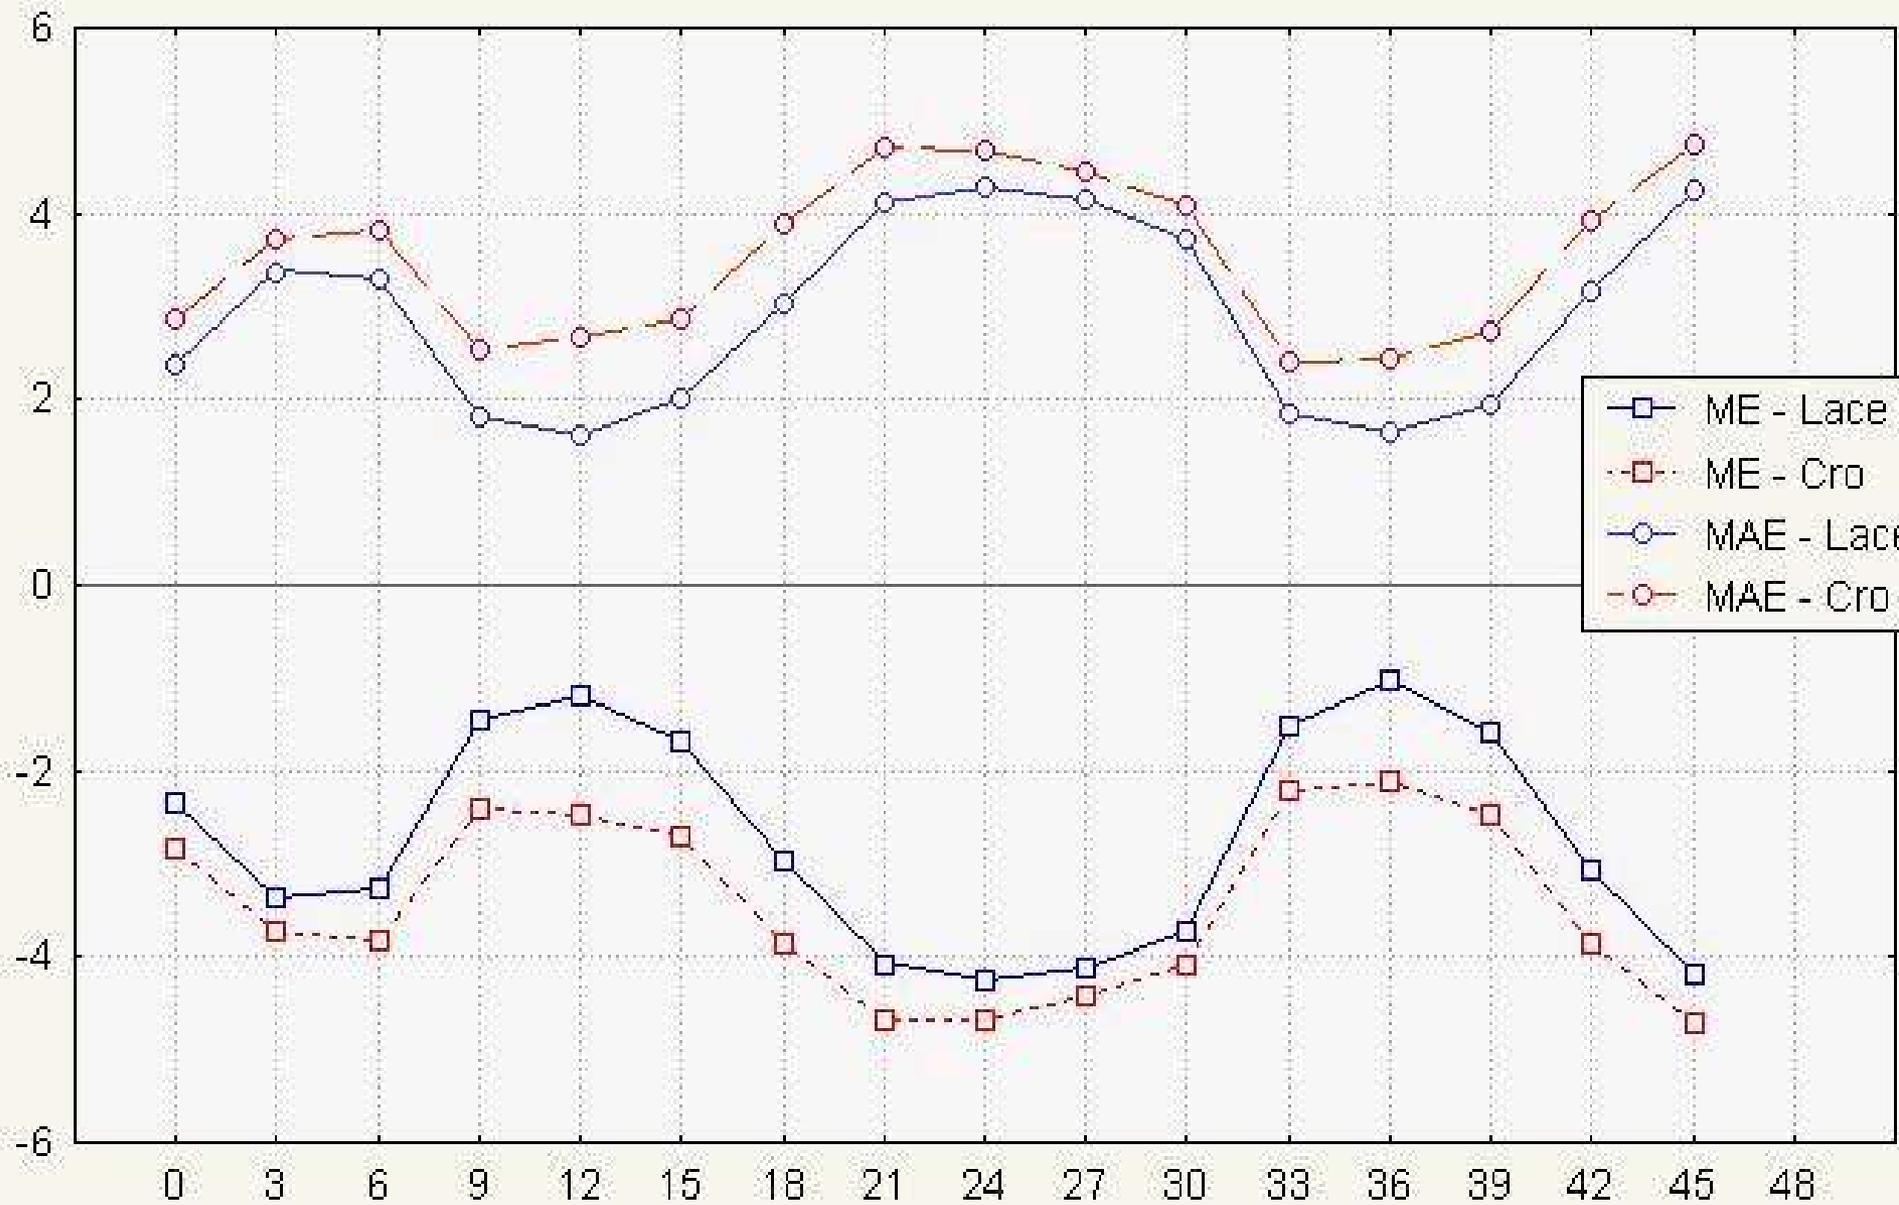

Temperature for Zagreb Maksimir (continental)
Jan - Dec 2004

Temperature for Gospic (mountain)
Jan - Dec 2003

Temperature for Split
Jan - Dec 2004

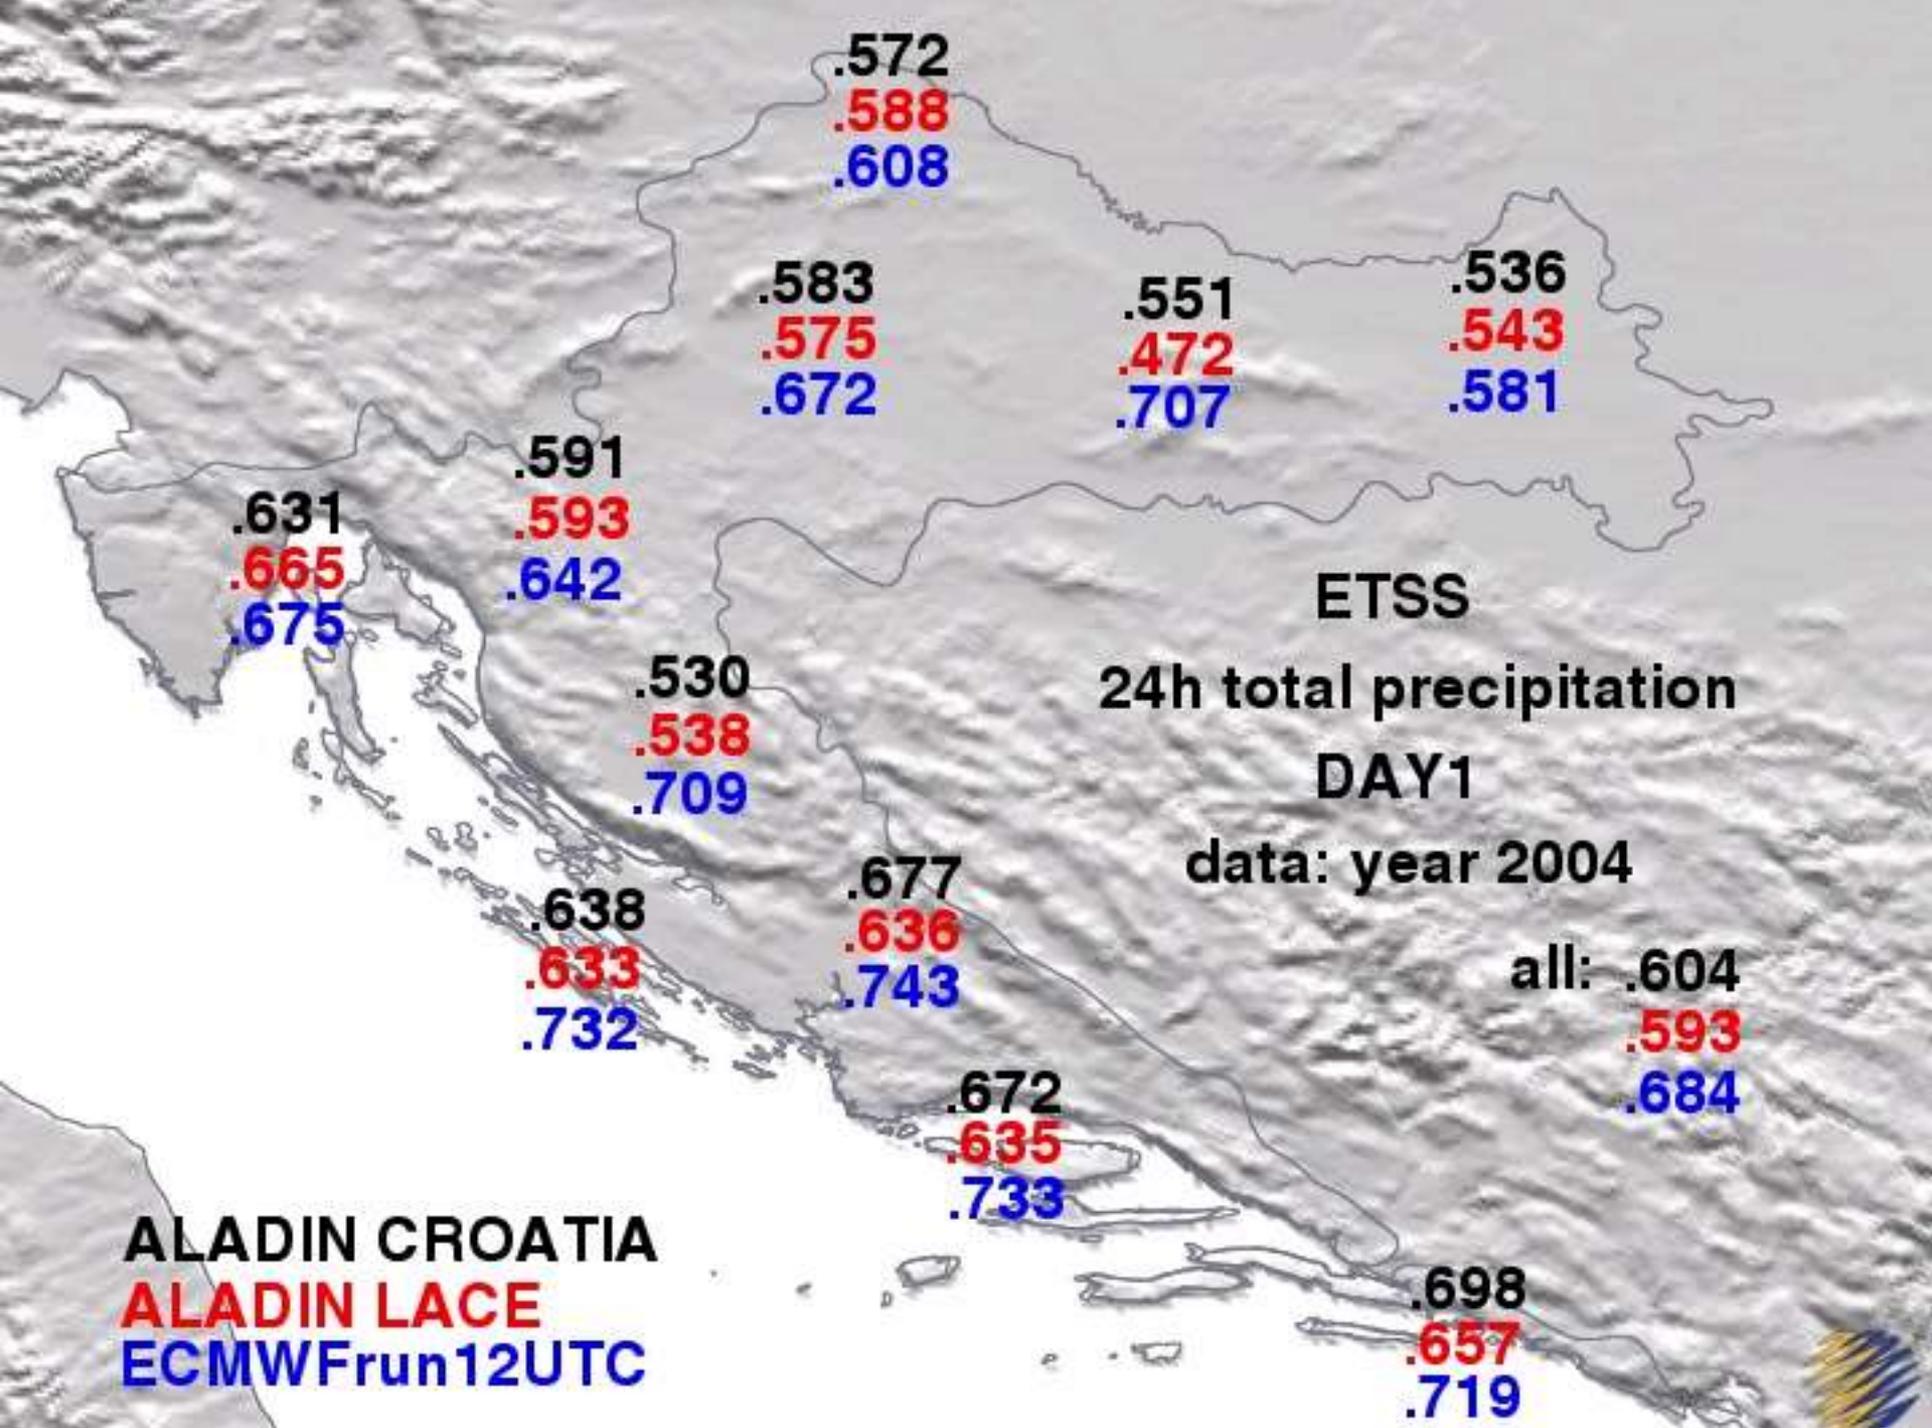

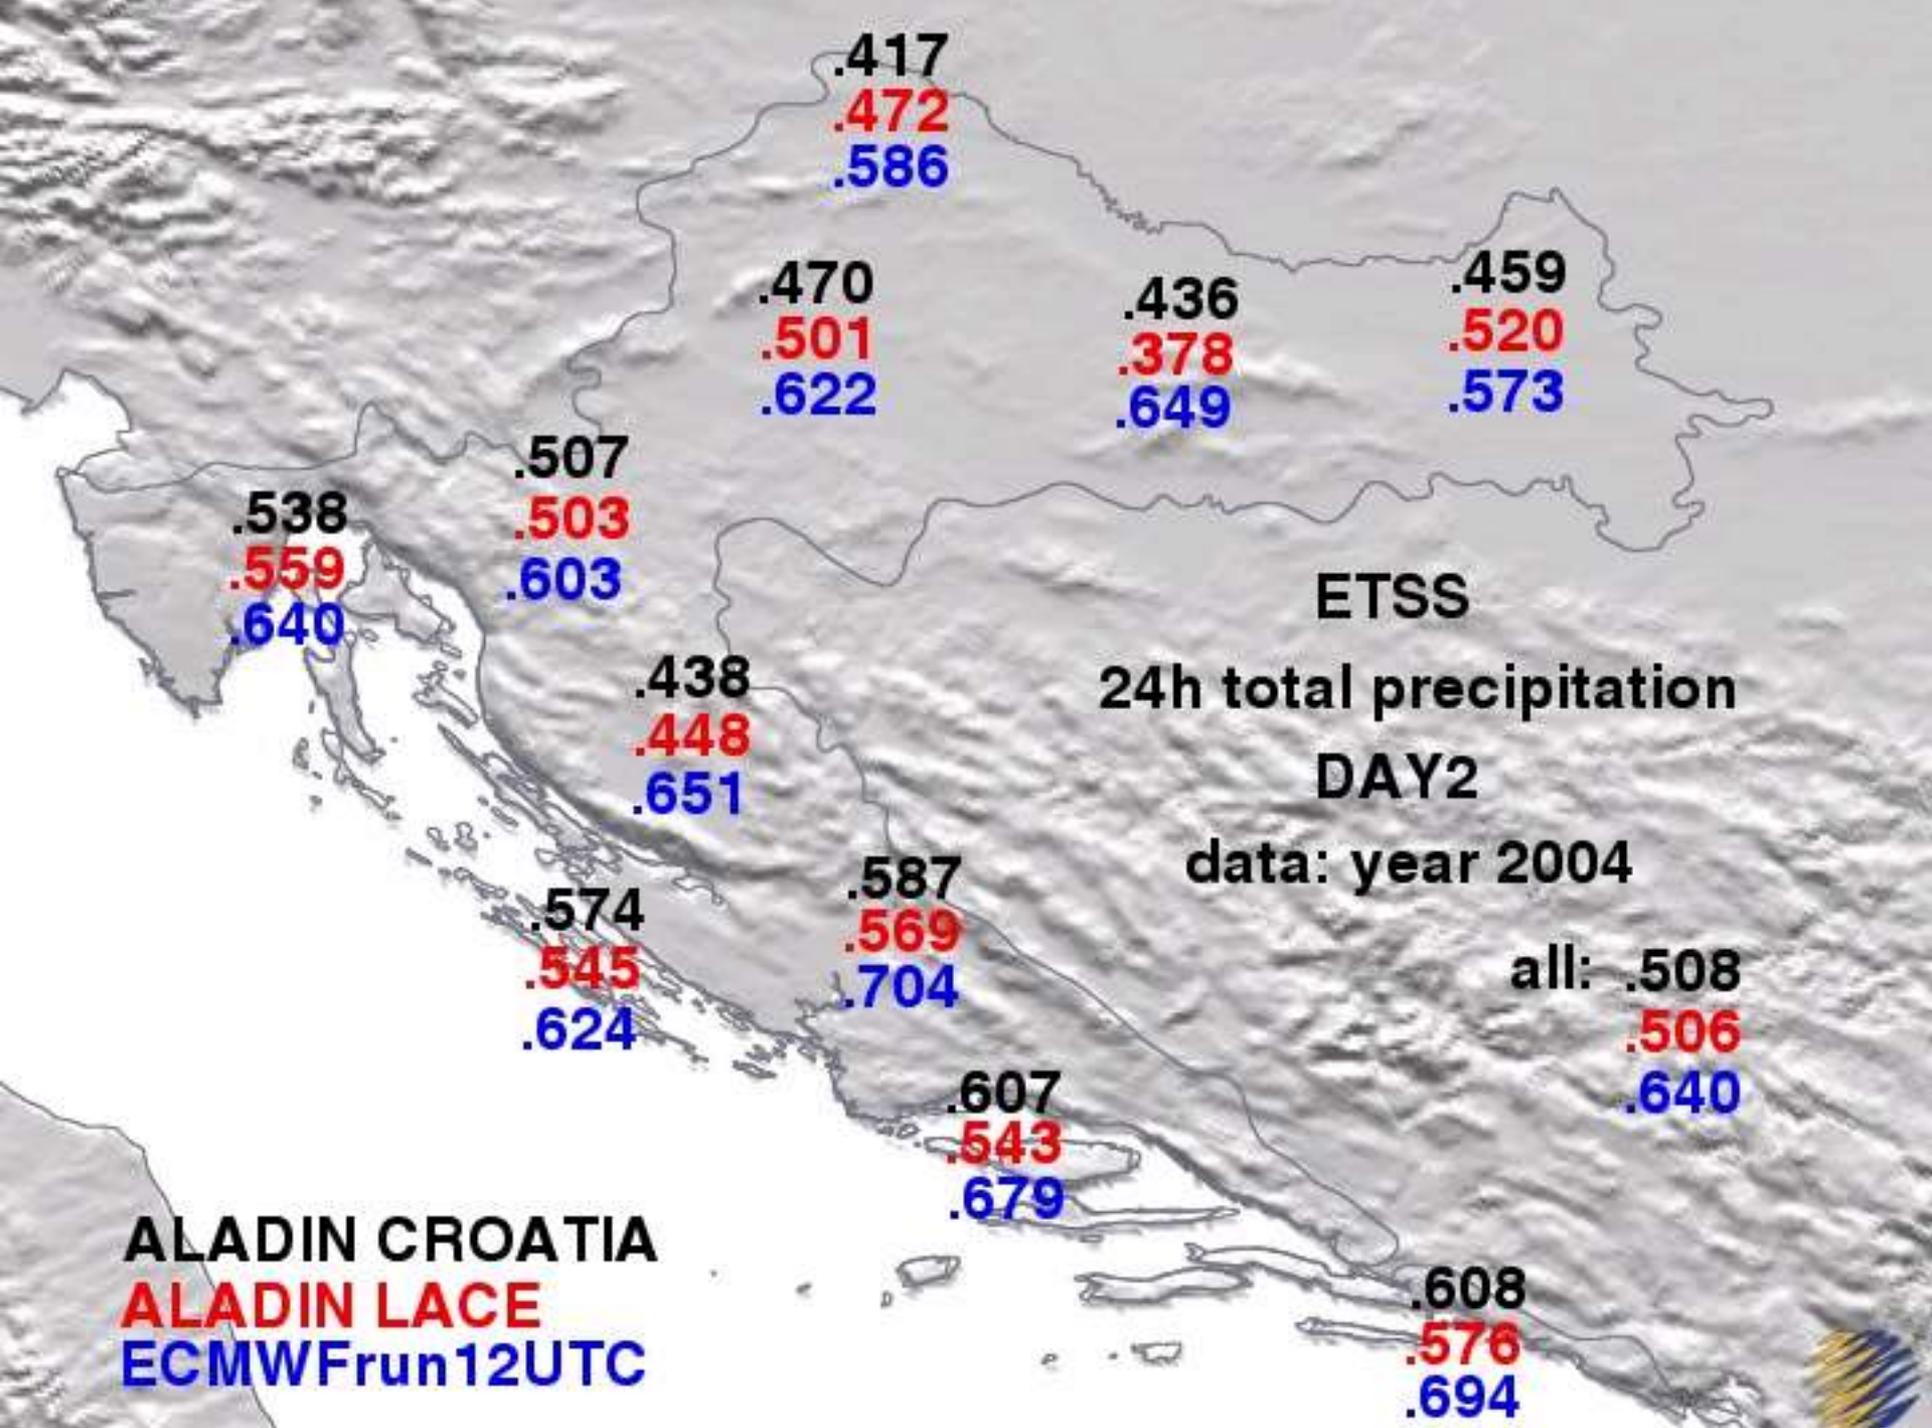

Precipitation

- 24 hour, 6 hour and 3 hour precipitation
- scores:
 - bias
 - KSS (Hansen Kuipers Skill Score)
 - HSS (Heidke Skill Score)
 - ETS (Equitable Threat Score)

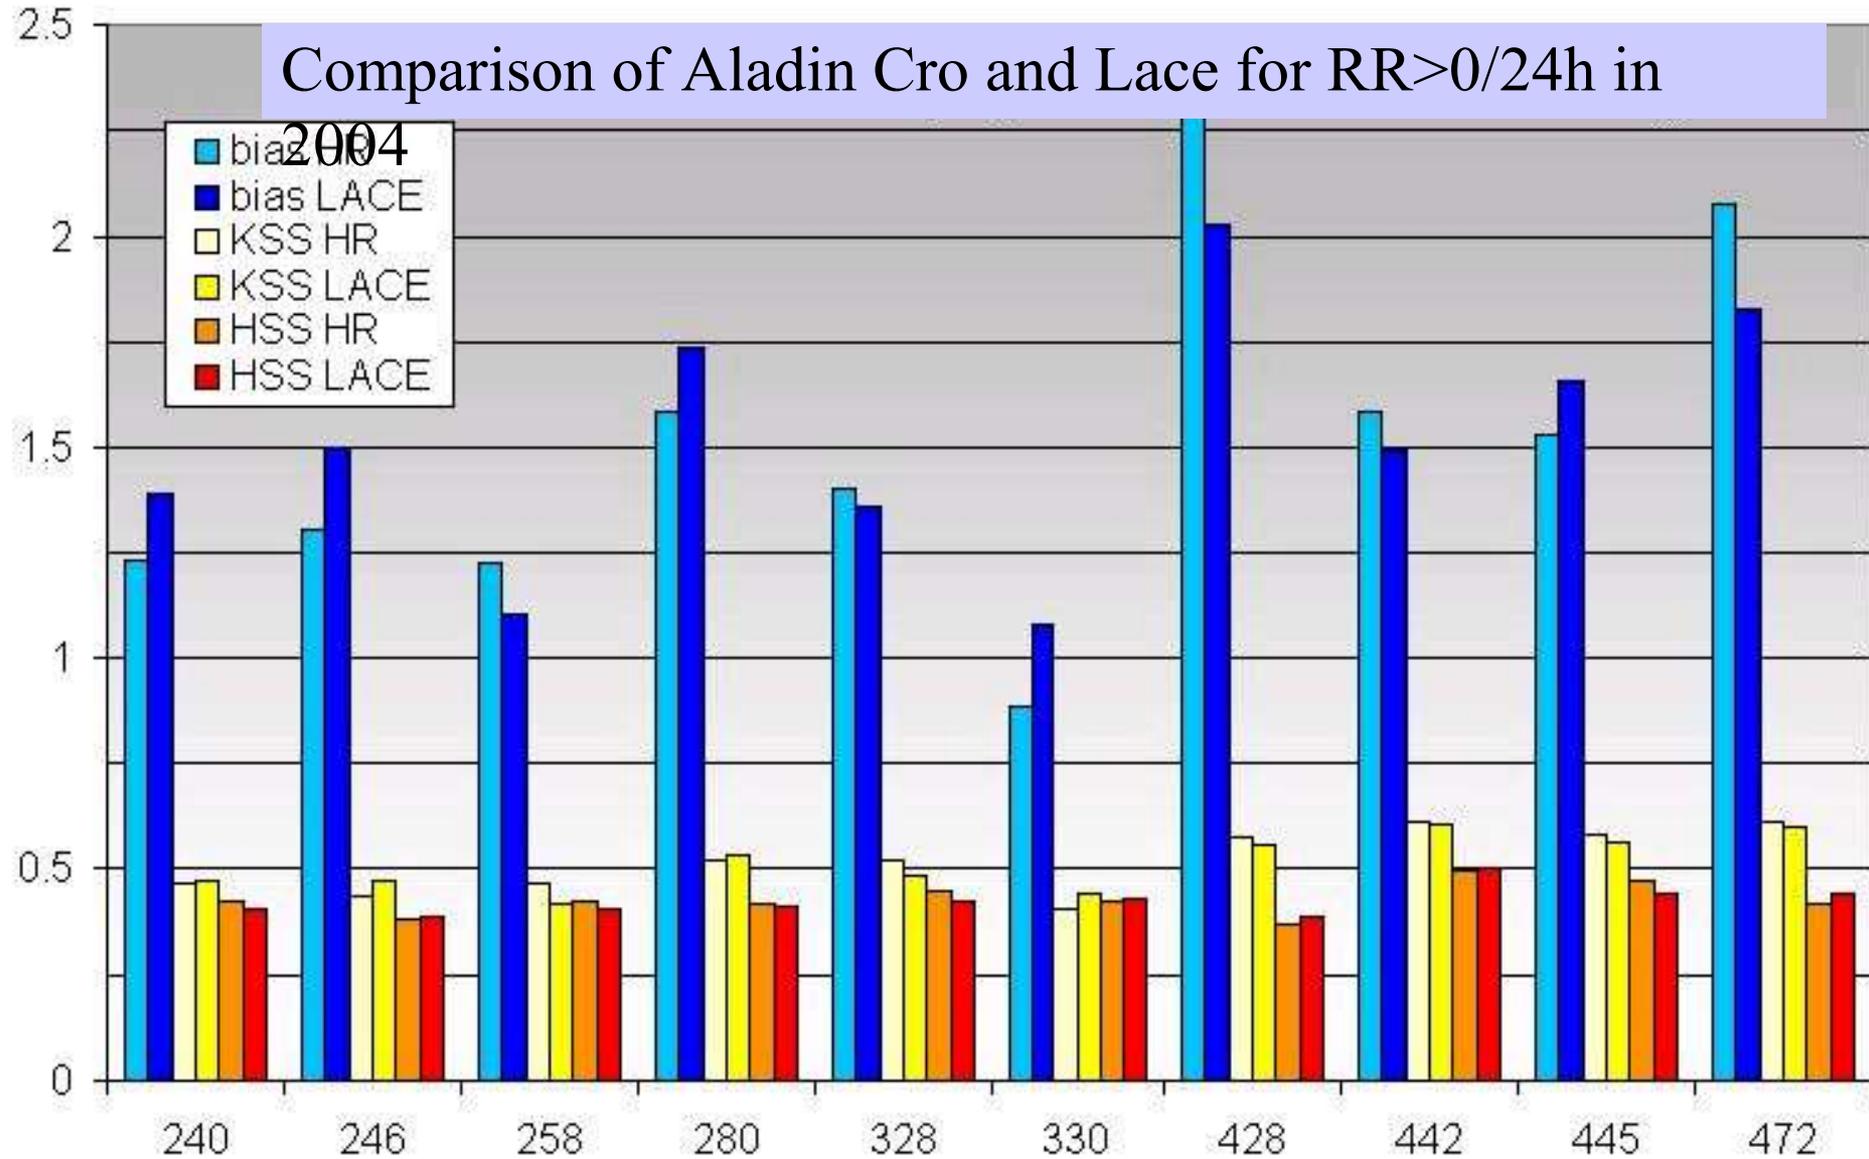

Skill Scores

- range mostly from $-\infty$ to 1
or from -1 to 1
- $SS=0$ zero skill (climatology,
persistence...)
- $SS=1$ perfect forecast

Aladin / ECMWF
RR>0 0 to 48 hours
Zagreb Maksimir Jan - Dec 2004

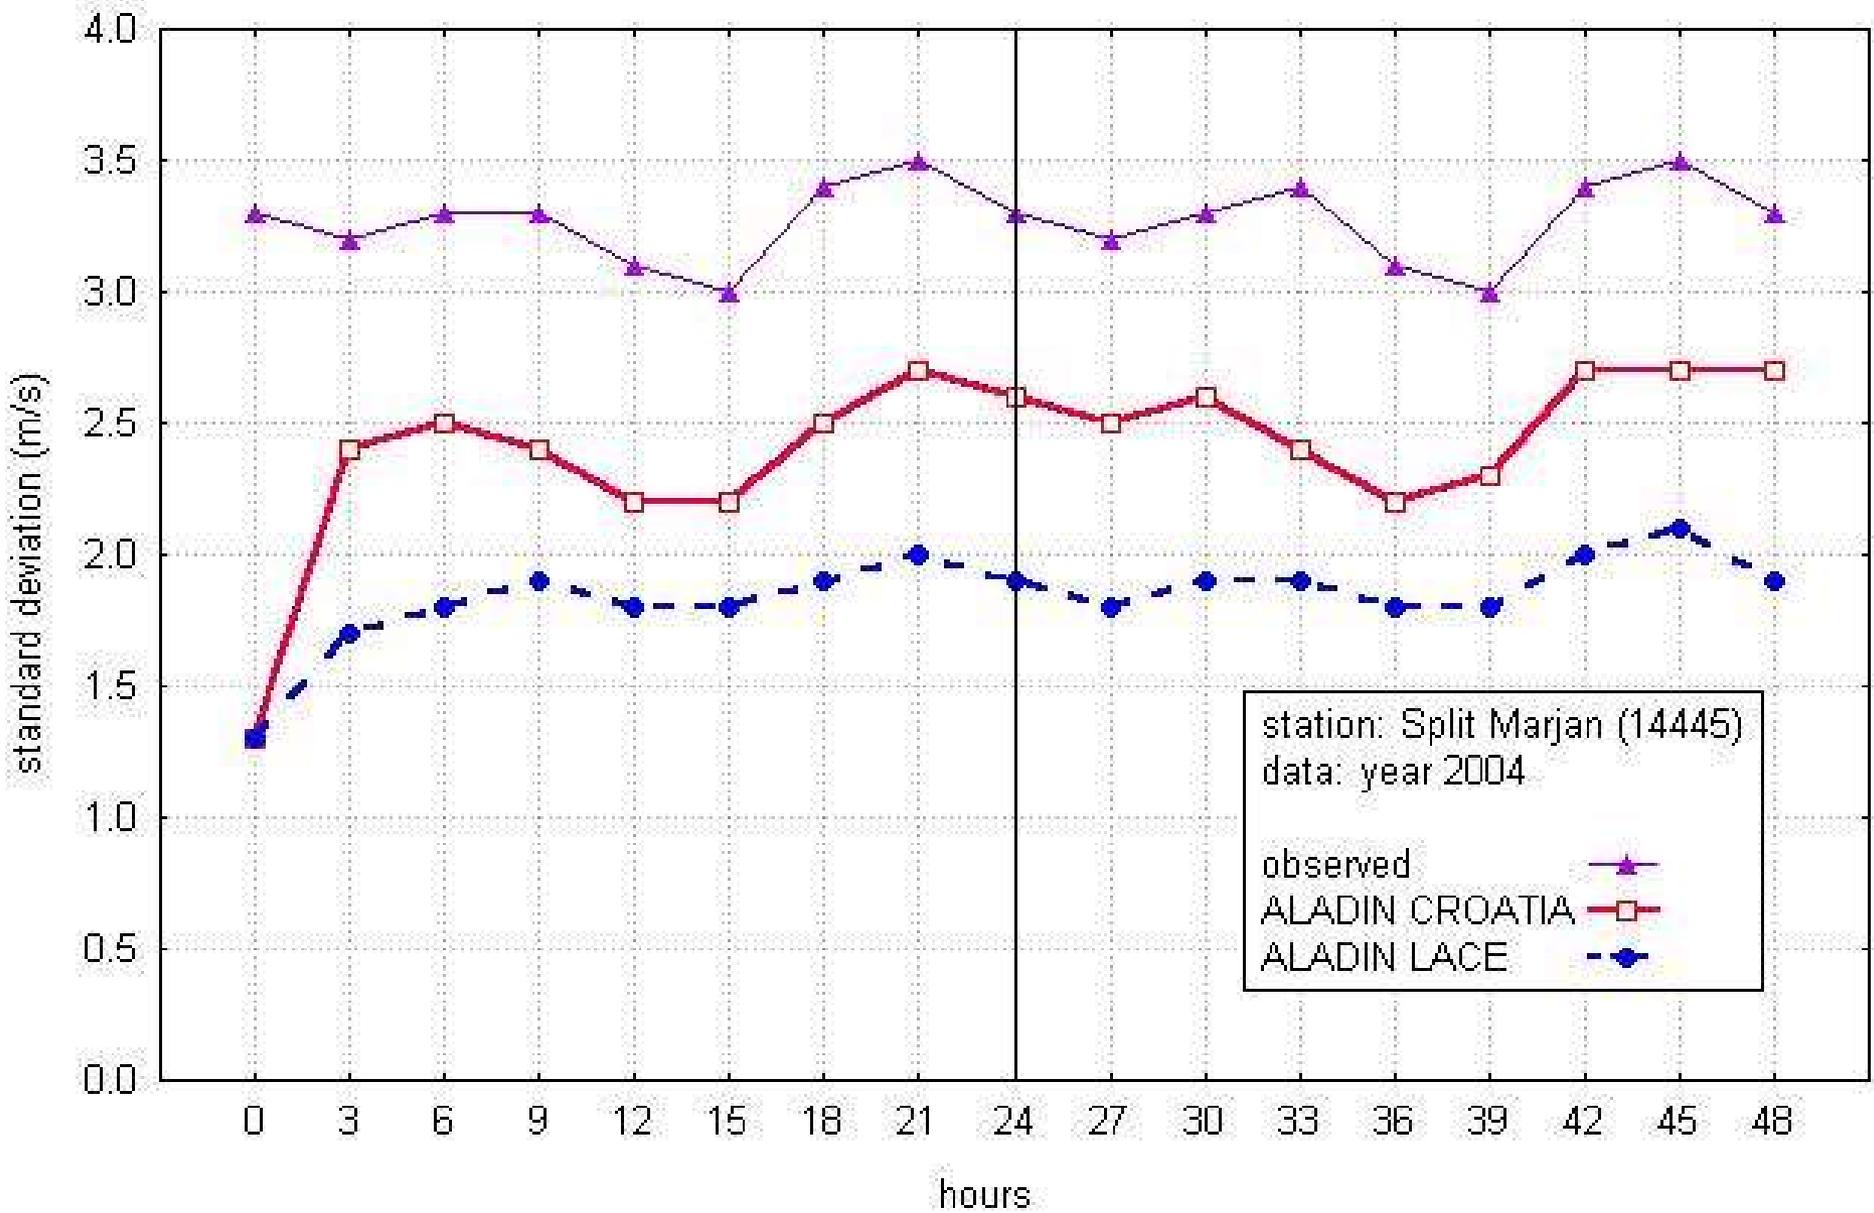

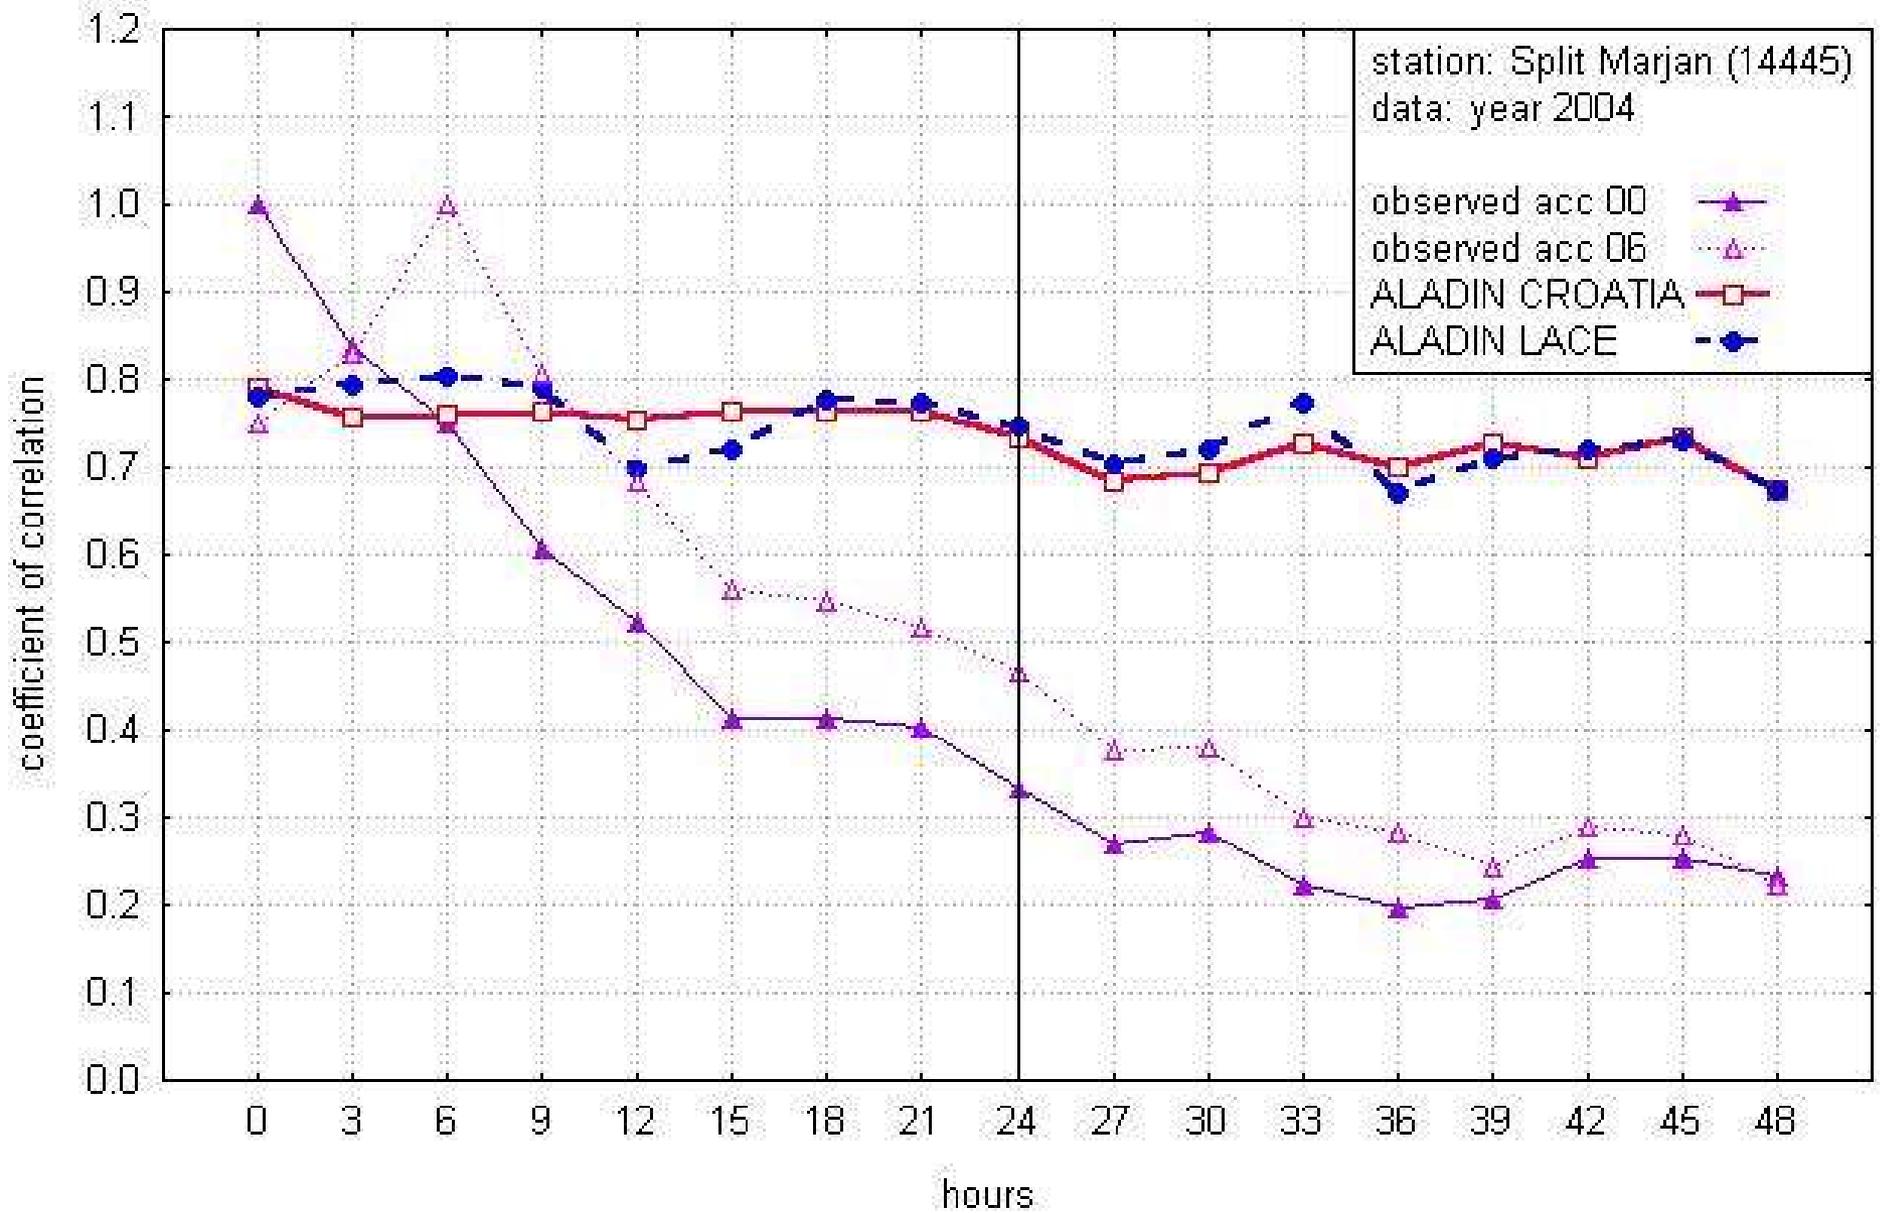

ALADIN CROATIA - 00 UTC run - precipitation rr > 0.0 - Sep 2003 to Mar 2004 for 3 points

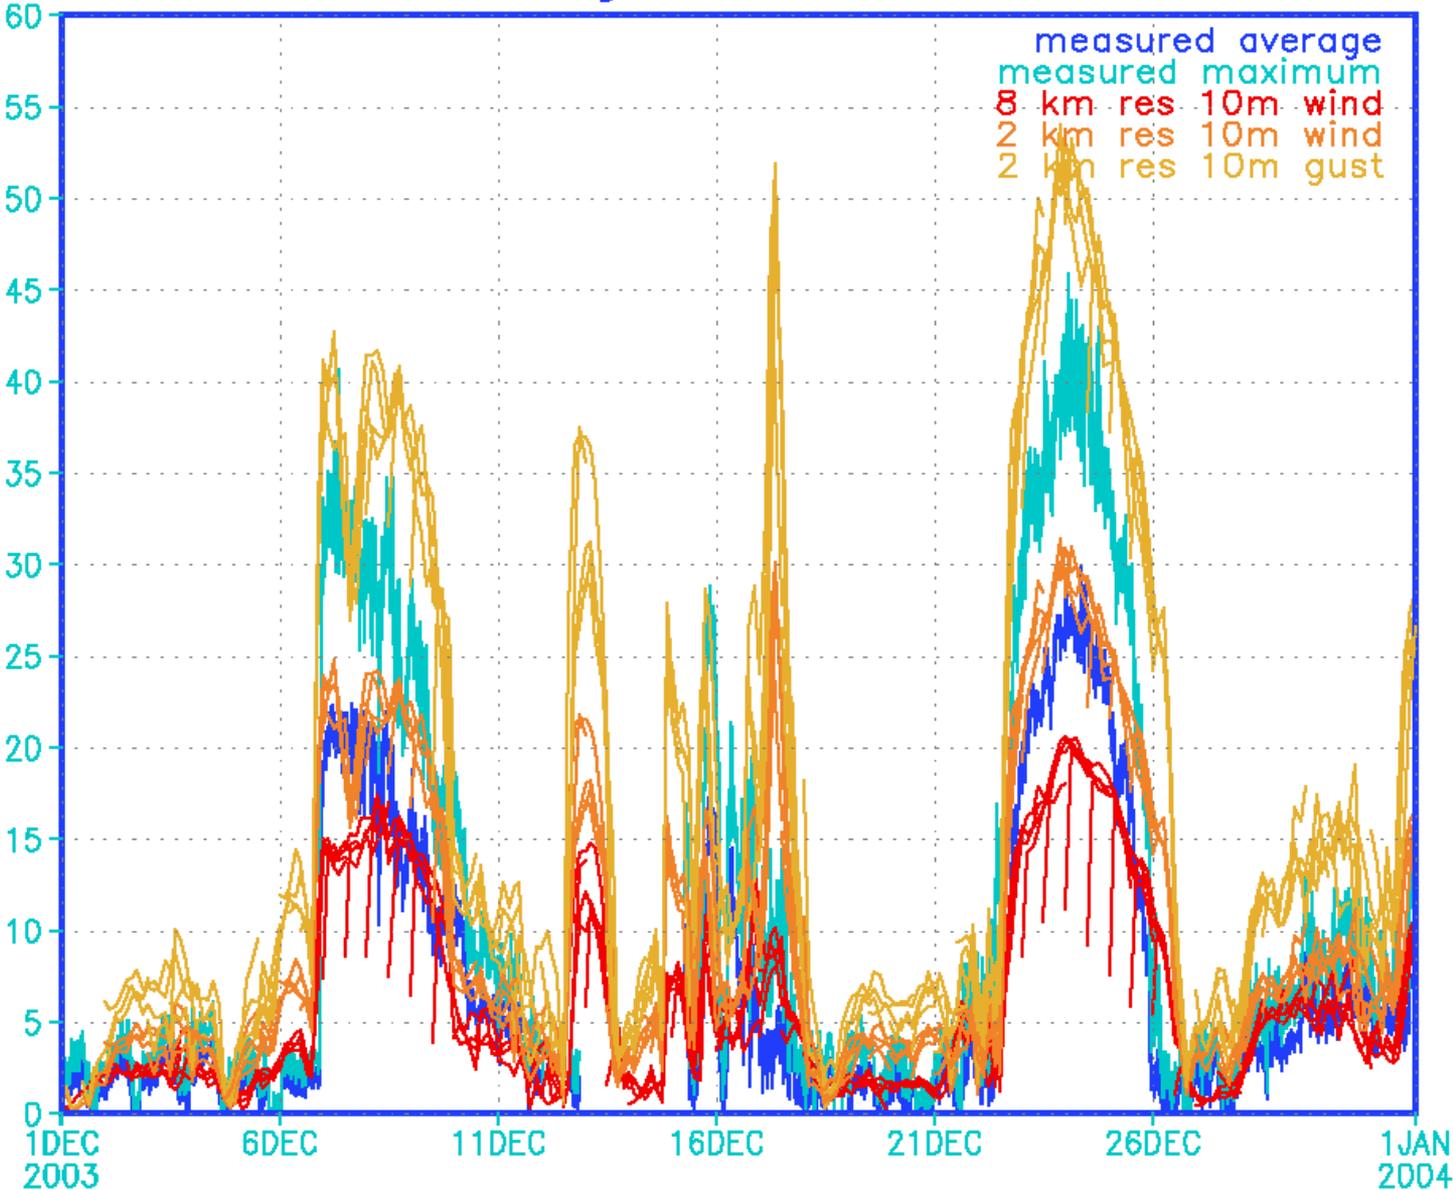

Wind

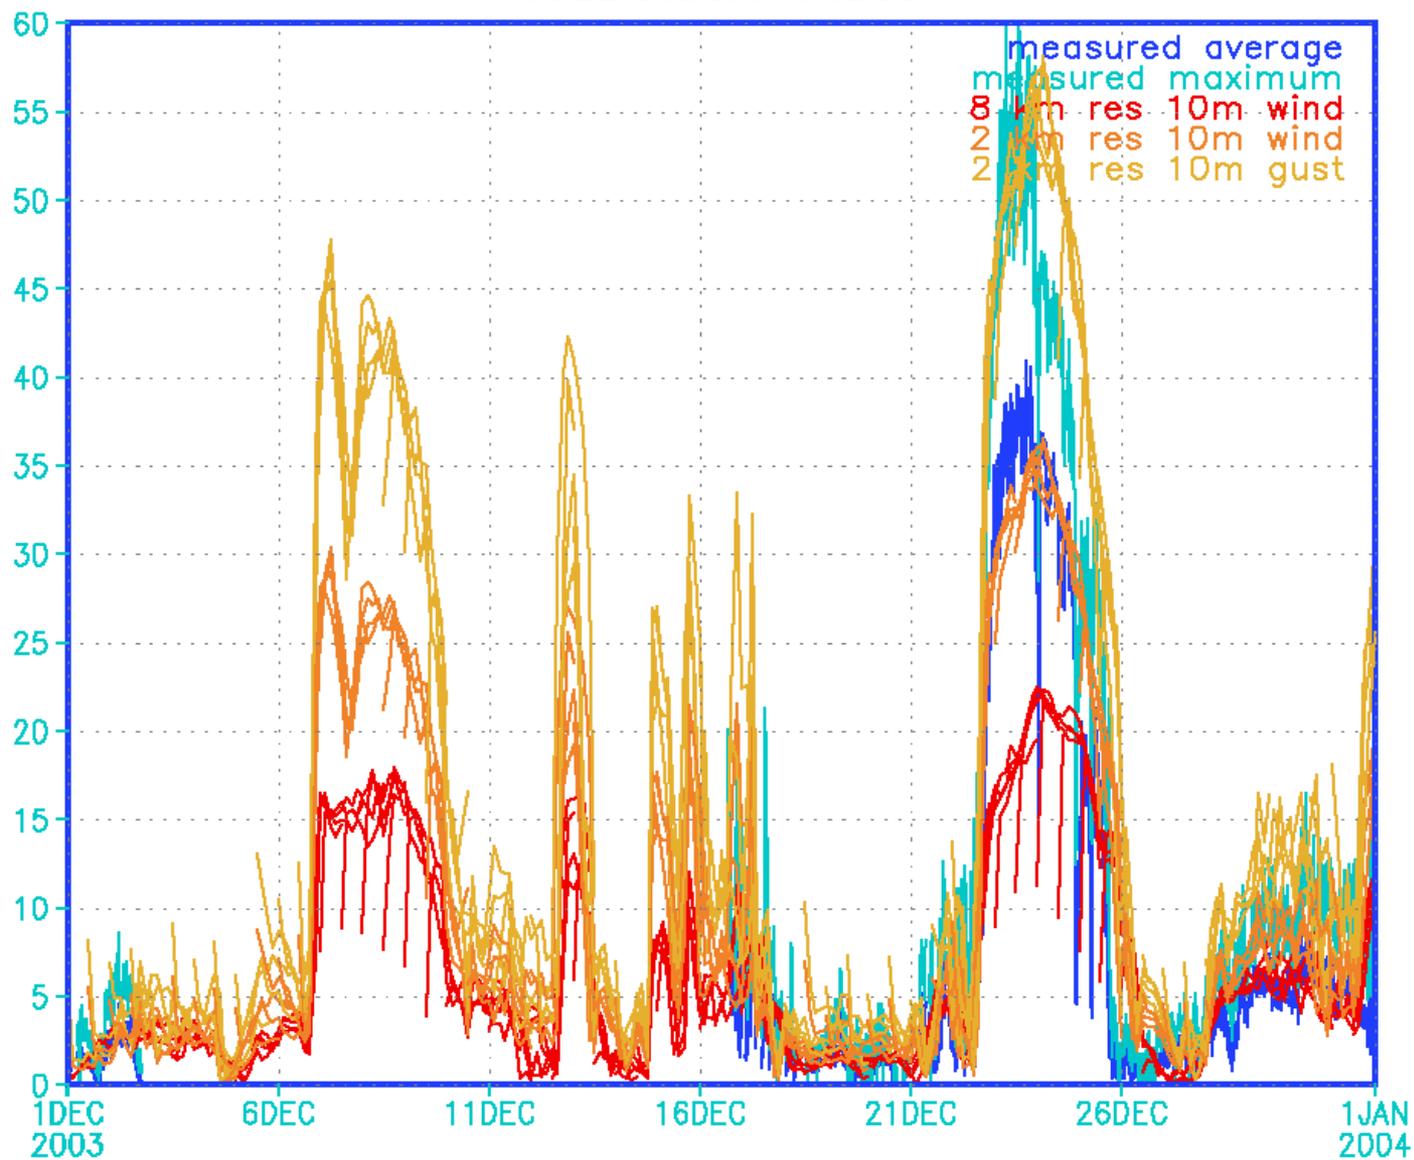

Vijadukt Bozic

Maslenicki most

Conclusions

- Problems:
- overestimating precipitation (“too wet”)
- significant daily variation of ME for temp

Conclusions (contd...)

- scores show **general improvement** in time and particularly compared to original Aladin Lace model
- temperature better biased
- reduced daily variation of temperature bias
- dynamical adaptation of wind field better predicts strong wind gusts, especially for katabatic processes at the coast (bura)

Future...

- new features (ver precipitation against radar measurements, ...)
- establish a verification package that will run operationally (monthly, seasonally, yearly)

Thank you for your
attention !
