

Impact of the horizontal resolution and the microphysical parameterization on the QPF over Austria

E. Bazile, F. Wimmer, Y. Seity and Y. Wang

- 1** •NWP models and experimental setup
- 2** •Verification dataset
- 3** •QPF verification results
- 4** •Discussion and conclusions

NWP models and experimental setup

- ARPEGE-GM: variable mesh 23km over Europe dt=15mn (L41)
 - oper: diagnostic cloud scheme
 - parallel : Prognostic Cloud Scheme (PCS) ql,qi,qr
- ALADIN-MF: 9.5km, (L41) dt=7mn
 - oper: 3DVAR analysis BC from ARPEGE
 - parallel: oper + PCS
- ALADIN-ZAMG: 9.5km, 45L dt=7mn, BC from ARPEGE
 - oper : dynamical adaptation
 - test : oper + PCS

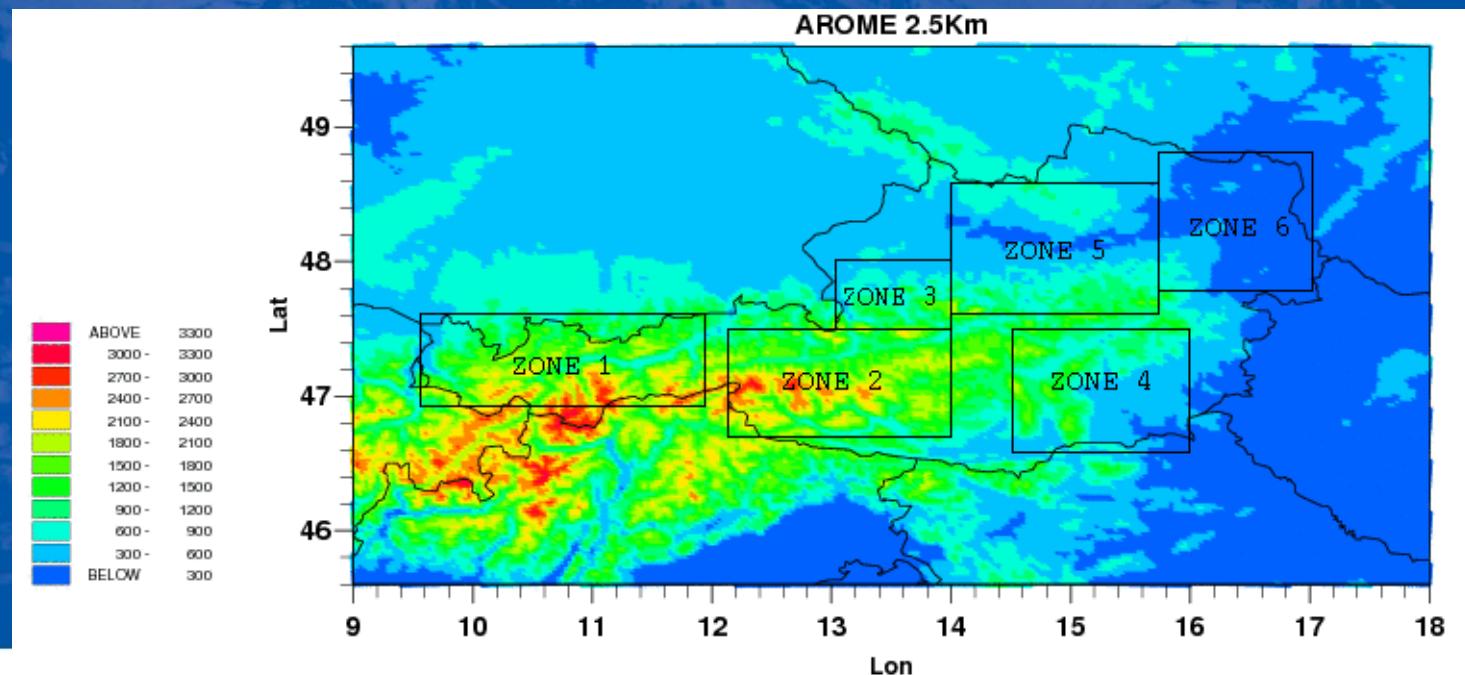

NWP models and experimental setup

AROME (Application de la Recherche à l'Opérationnel à Méso-Echelle)

- 2.5km L41 dt=1mn NH . BC from ALADIN 3h
- Dynamics from ALADIN
- Physics from the research NH model: Méso-NH
- Microphysics: ql, qi, qrl, qsn, qq
- Convective parametrization is switched off

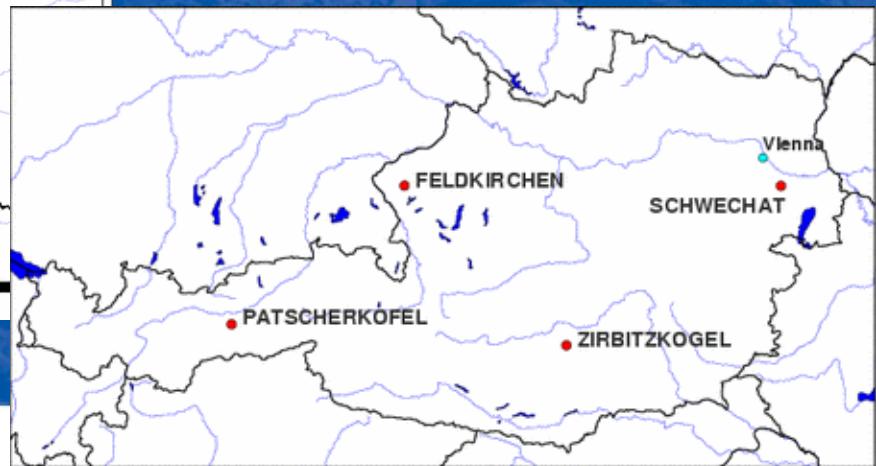

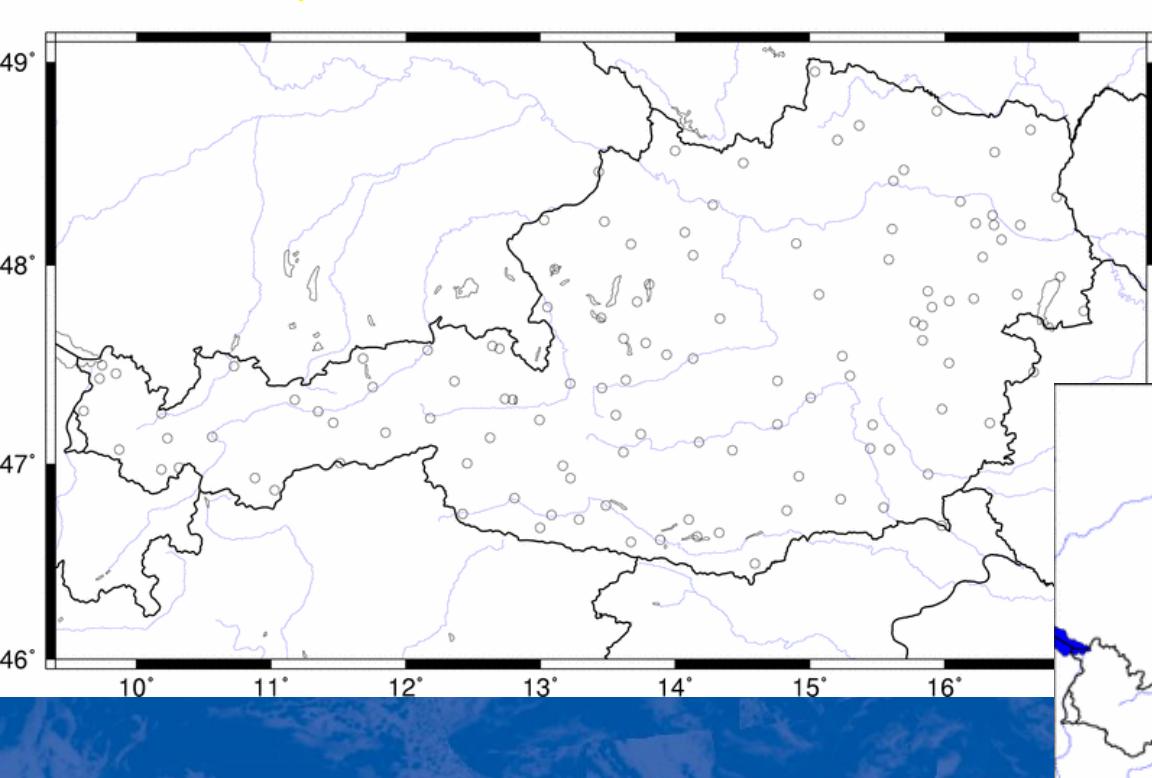

NWP models and experimental setup

- Two periods: August and October 2005.
- 24h forecasts starting at 00UTC
- Two comparisons:
 - 24h precipitation accumulation (20km grid)
 - 0-6h, 6h-12h, 12h-18h, 18h-24h (10km grid)

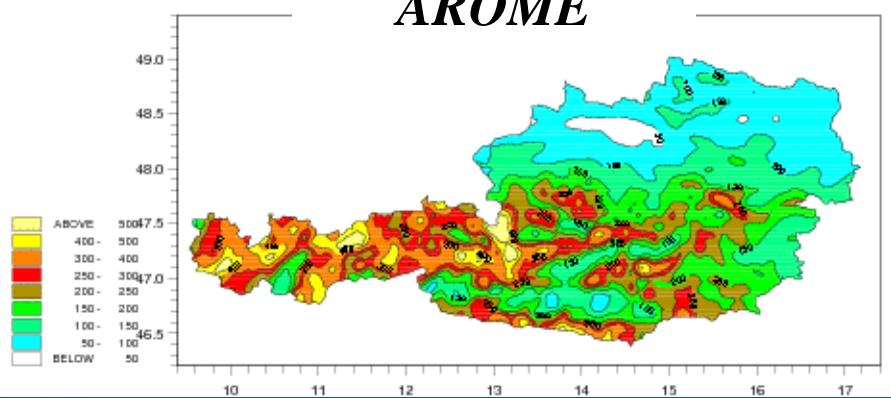

Verification dataset

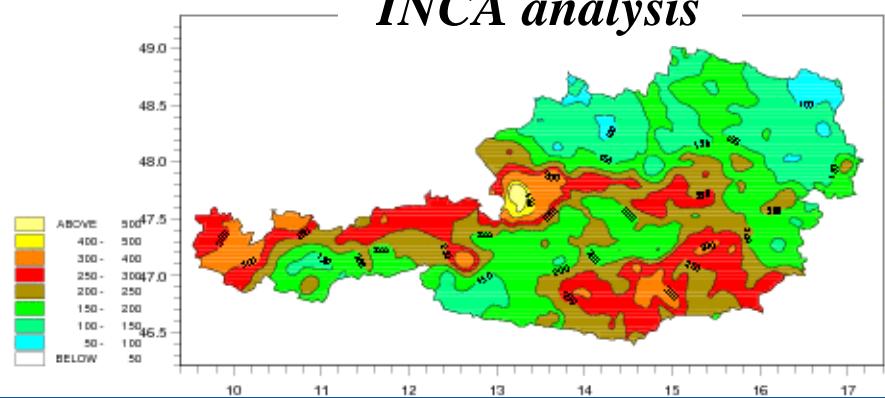

- INCA analysis (Integrated Nowcasting through Comprehensive Analysis) at 1Km (Haiden et al. 2006)
- The precipitation analysis is a synthesis of station interpolation (1km) and radar data

ALADIN MF+PCS

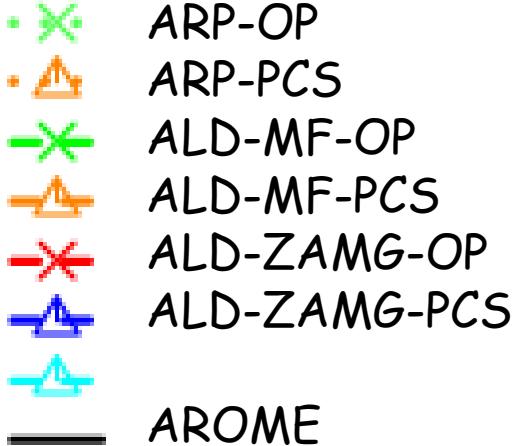

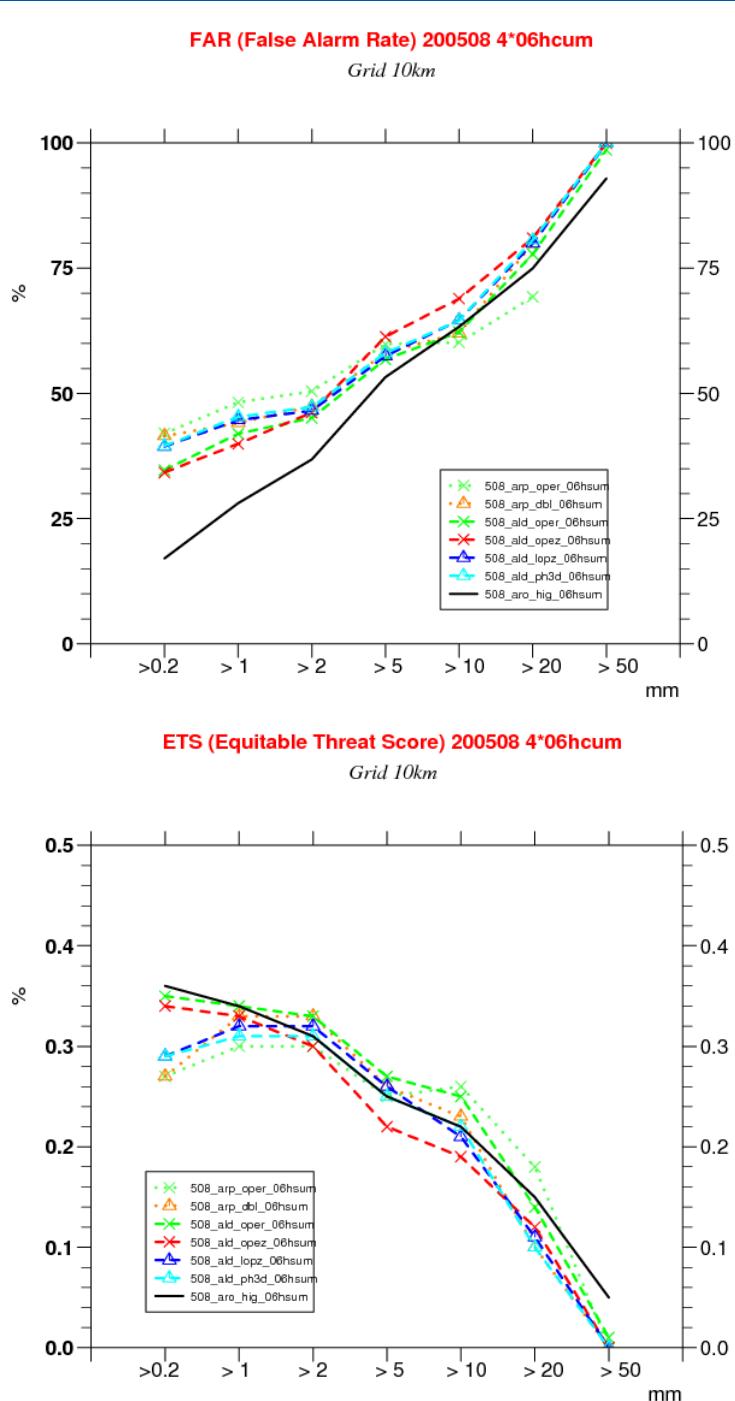

August 2005
 24h accumulated precipitation
 (20km)

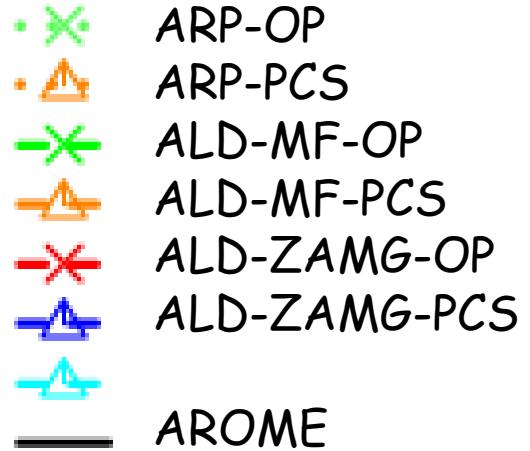

- PCS increases the FAR for RR < 2mm
- AROME has a less FAR for all classes and the ETS is improved

August 2005
 6h accumulated precipitation
 (10km)

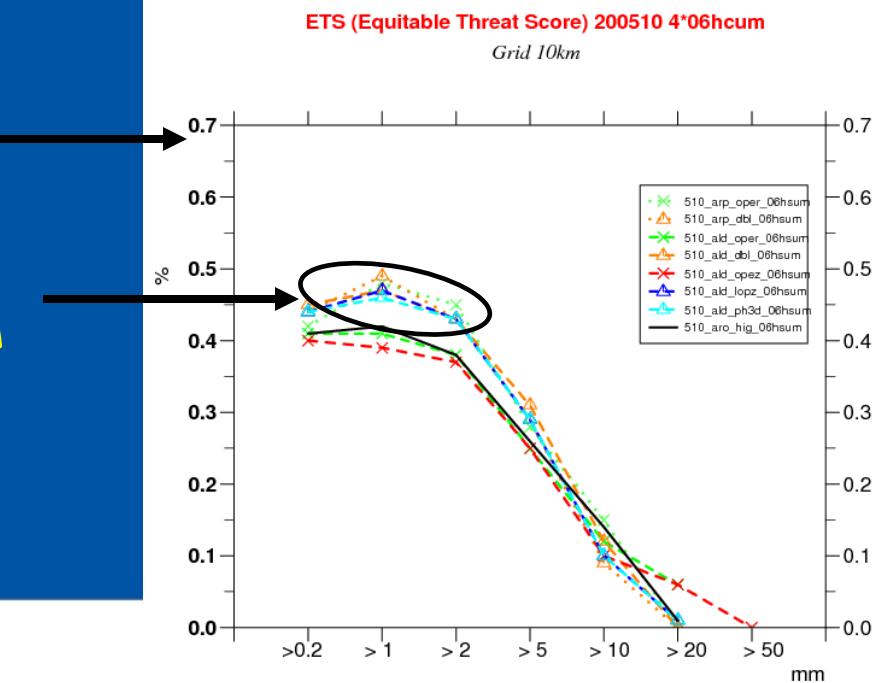

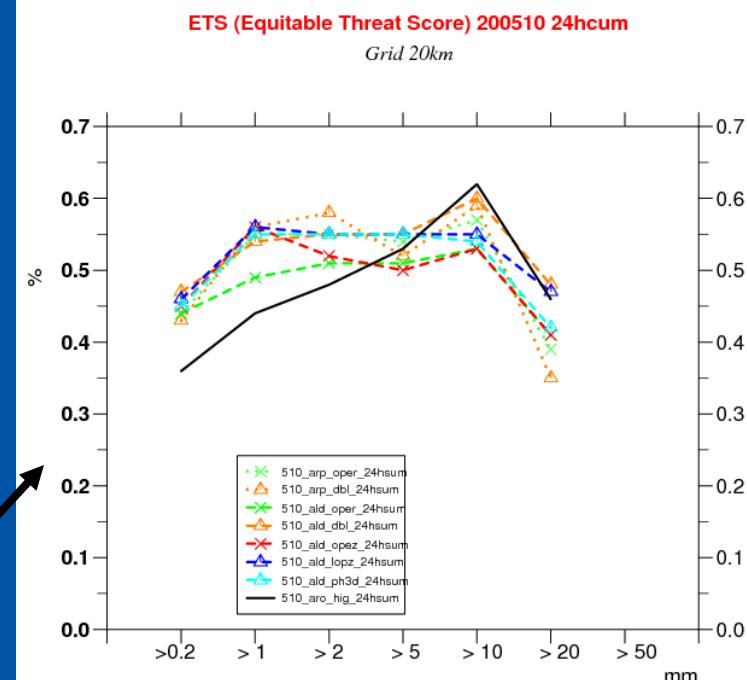

October 2005
24h accumulated precipitation (20km)

6h accumulated precipitation (10km)

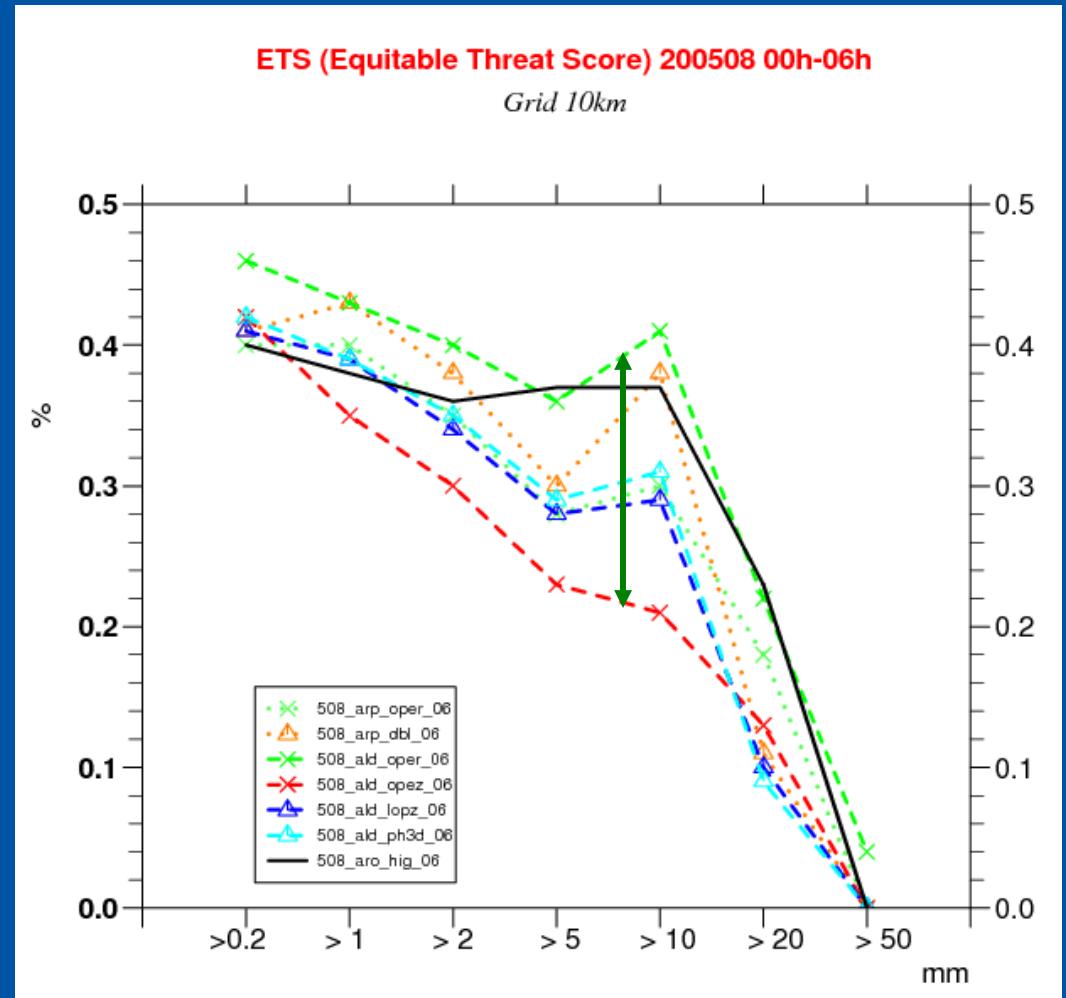

- PCS improves ETS for $1\text{mm} < \text{RR} < 5\text{mm}$
- AROME underestimates the precipitation below 2mm

Correct forecast/(all the forecasts)

August 2005
October 2005

- ASCII file for analysis and model : lon lat value
- File name AAAAMMMJJ00+HH
- 00UTC forecast: output 06h, 12h, 18h, 24h
- cumulated precipitation on the model grid
- August, October 2005 and April 2006 (in plan)
- HIRLAM will send the data (ST)
- and ALADIN-XX ?

Conclusions

1. The statistical skill scores confirm the improvement of the first 6h precipitation forecast due to the 3DVAR analysis.
2. The PCS reduces the rainfall overestimation on the mountain area with a better precipitation field on the lee side part.
3. The skill of the AROME "prototype" in predicting the precipitation over Austria is slightly better especially over mountain. Nevertheless, AROME under estimates the smallest precipitation amounts
4. Increase the period → results statistically significant

Thanks for your attention ...
