Delivering global predictions

46r1: overview

- continuous data assimilation;
- twice the number of members in the ensemble of data assimilations (EDA);
- weakly-coupled data assimilation for sea-surface temperature in the tropics;
- increase in the frequency of the ensemble radiation time step to 1 hour (from 3 hours)
- assimilation of the SMOS neural-network soil-moisture product.
- activation of long-wave scattering in radiation scheme
- activation of wave-current interaction in the wave model

46r1: Scores

500hPa geopotential
Anomaly correlation
NHem Extratropics (lat 20.0 to 90.0, lon -180.0 to 180.0)

Comparison with other centres: precipitation forecast probabilistic skill

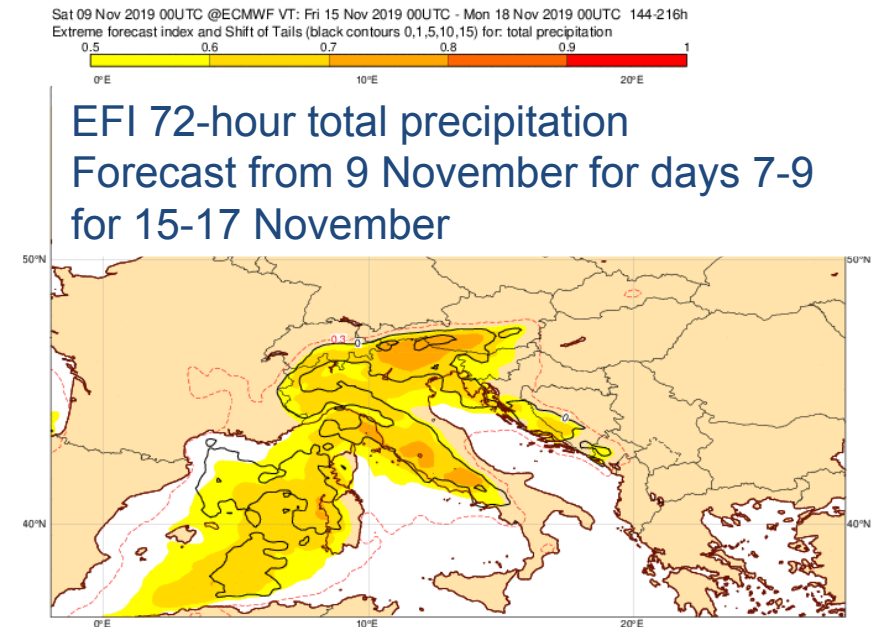

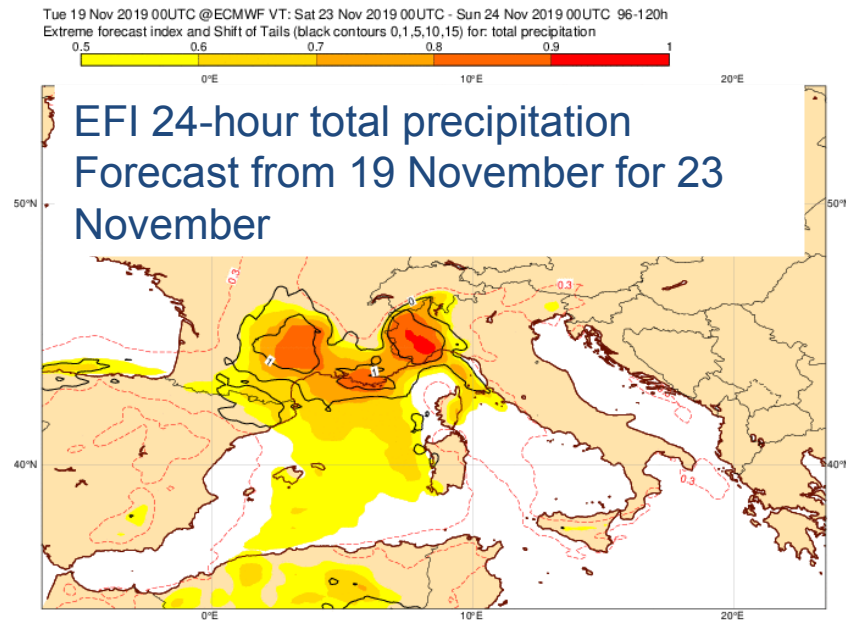

Pre-Bologna ultimate cycle: 47r1

- A new formulation of **weak-constraint 4D-Var**
- Quintic vertical interpolation in the semi-Lagrangian update (which together with the above gives **improvements to stratosphere** in particular)
- MODIS land surface albedo, which is **good for 2 m temperature**
- Shorter, 450-second time-step in last minimisation – bringing consistency with the outer-loop time-step, and thus **removing spurious gravity waves and improves scores**
- Use of the ‘first guess’ from the most recent early delivery run in the LWDA (long-window data assimilation) analysis – this is a next step along the path to **more continuous data assimilation**
- Changes to high wind drag over the ocean – these **address a long-standing problem with the wind-pressure relationship in tropical cyclones**.

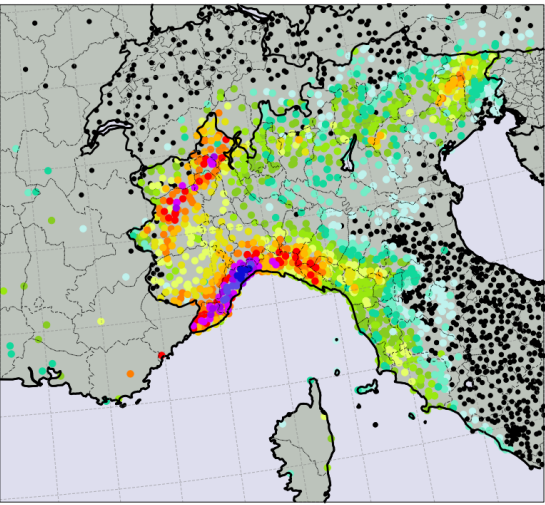

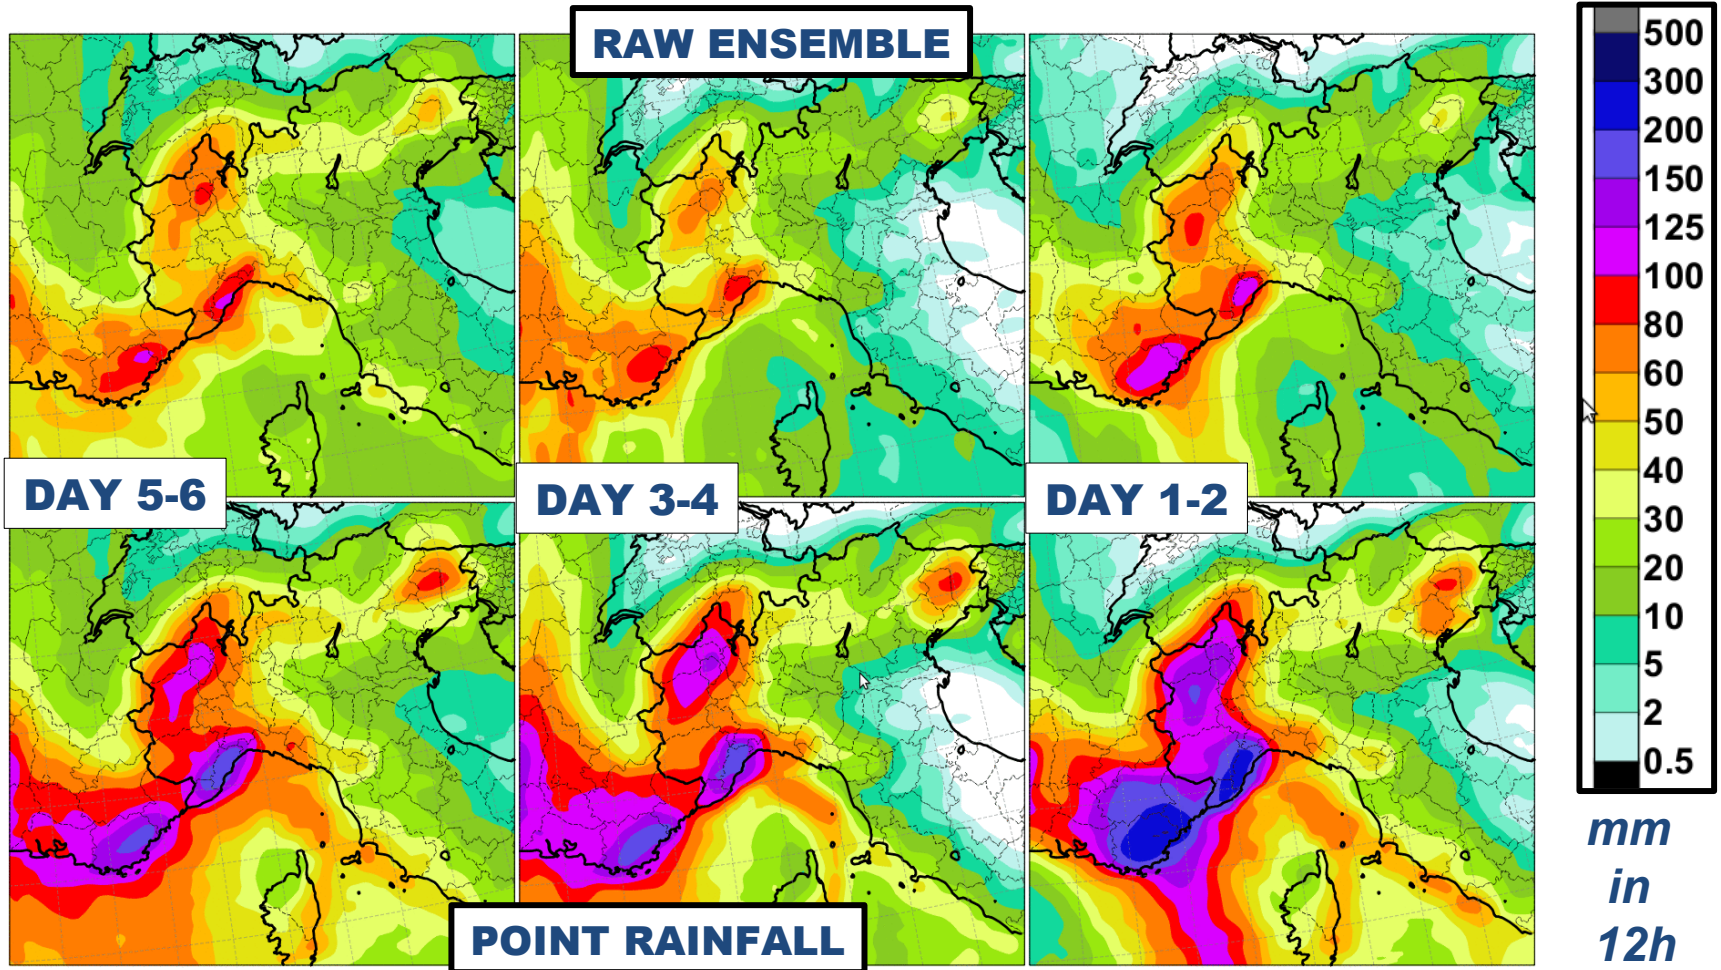

Extreme rainfall and flooding France, Italy, Austria November 2019

- Extreme precipitation NE Italy and W Austria 15-17 November
 - reaching 50-year return period in Austria (up to 250mm), causing avalanches and landslides
- Intense rainfall S France and NW Italy 23 November
 - Destructive flash flooding
- Consistent signal of extreme in EFI from 1 week ahead

Floods in N Italy / S France – 23 Nov 2019

Forecasts Versus Observations (12h rainfall to 18UTC)

- Forecasts show a “worst case scenario” (99th percentile)
- Point rainfall much better at capturing the extremes

Artificial Intelligence in NWP: investigation stage

So far:

- A workshop run in collaboration with Oxford University
- A workshop run by ECMWF Copernicus Services
- Appointment of a coordinator across ECMWF
- Council Lecture!

New Meteorological Interpolation and Regridding (MIR) library

- Spectral transforms are faster (up to 3×)
- Global-to-global interpolations 2× – 3× faster in operational env. (caching + plan optimizations)

Carrying over computing power

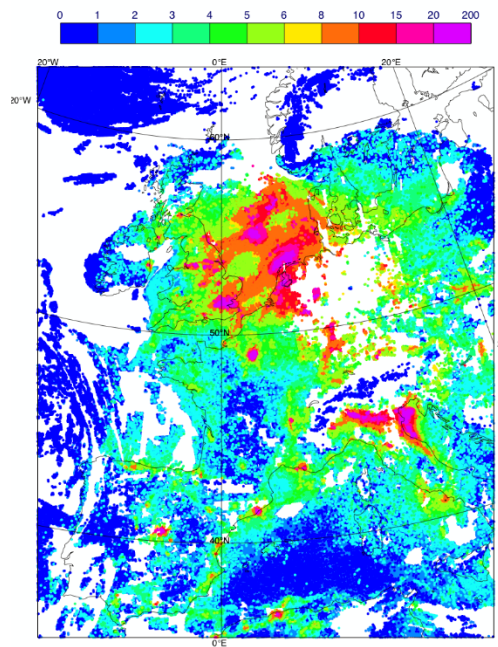

Uptake of Sentinel 5-P in CAMS: making the most of the IFS

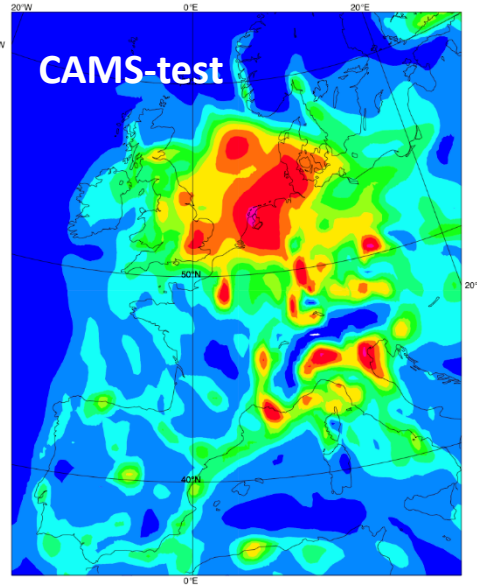

Operational monitoring and assimilation tests performing very well, especially for NO_2 . Assimilation on track to be activated in the next few months.

High pollution case 27/02/2019

S-5P observation

Assimilation
GOME2-A,B+OMI+S-5P

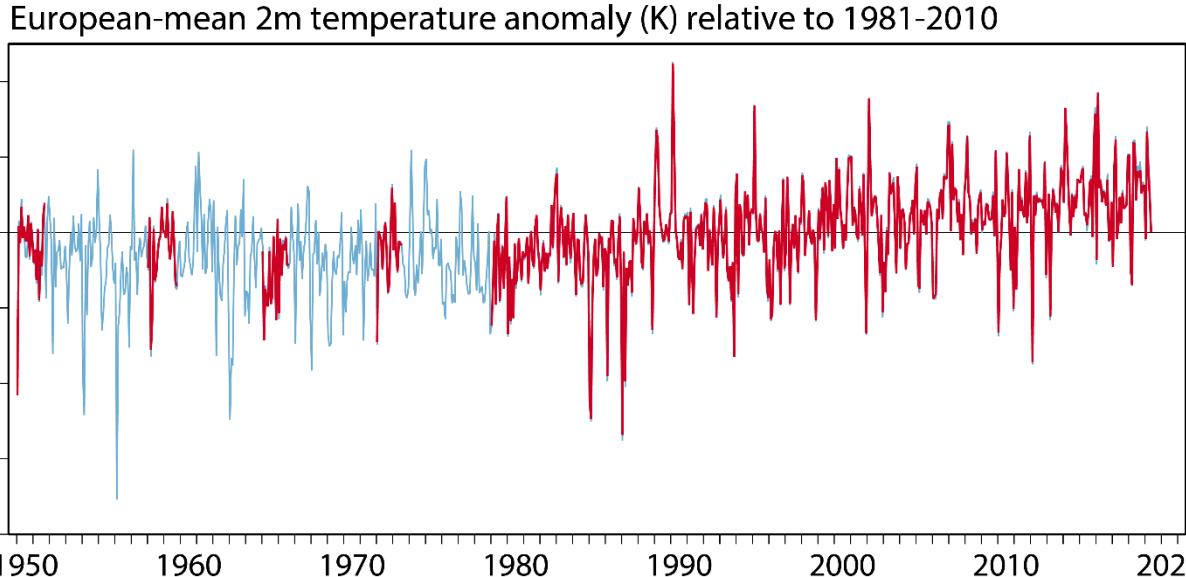

Assimilation
GOME2-A,B+OMI

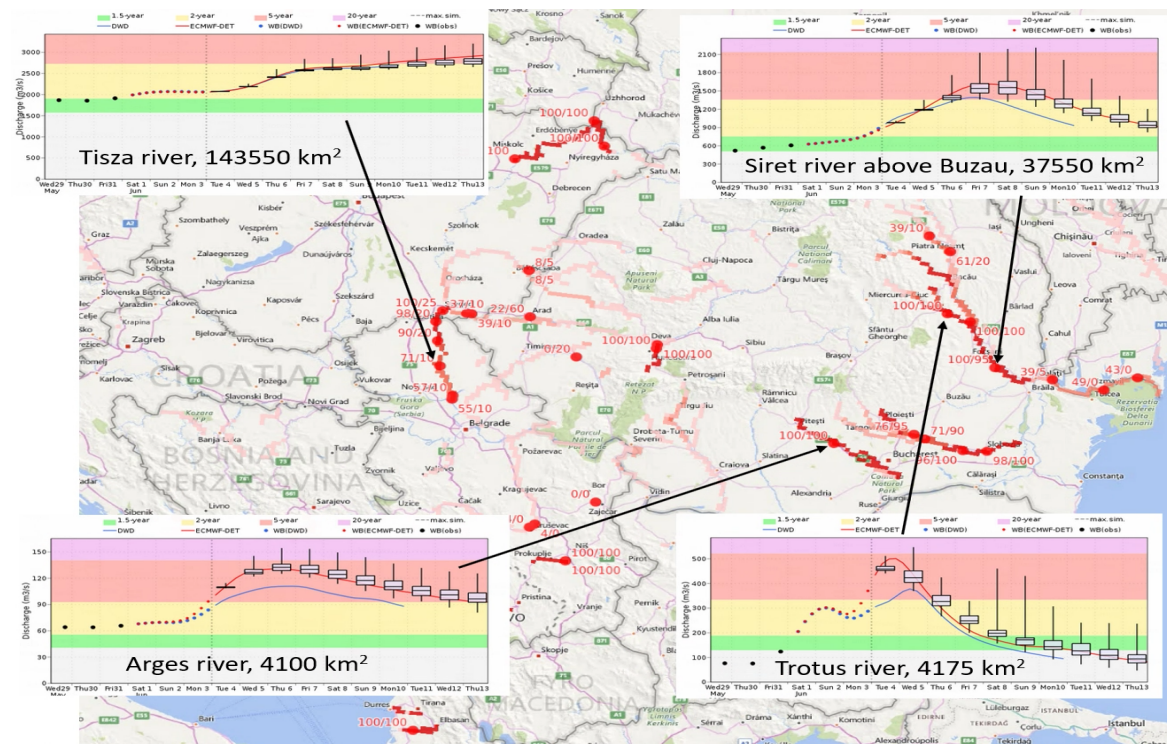

On that situation, the addition of Sentinel-5P data on top of the observations operationally assimilated (parallel test) had a visible impact, reducing in that case the amount of NO_2 .

Tropospheric column NO_2
